From: Paul
Topic: 7037 Message: 7037

I have been posting of late on the Eagle forum and have had people send emails to me to say that they had issues with the ergonomics of the Orion and Eagle. I am wondering if an Orion owners have found similar issues?

I was all set-up to purchase an IC-7600 when somebody mentioned I should have a look at an Eagle. Since I have had a look at Eagles I am now wondering about Orions.

This will be my first dabble into HF after some twenty years as a ham.

I understand that Orions are formidable radios, though are they easy to drive or do you wish you had spent your money on somethingelse?

Kind regards,

Paul VK3TPM

7038. CW keying

I am just getting my Orion set up. Purchased about a month ago but have been gone for 3 weeks.

In the manual it says that the front CW jack and the rear KEY are in parallel.

The front one works fine but the KEY in the rear will not key the radio. Am I missing something or maybe it has a severed connection between the two jacks?

I prefer to use the rear one to keep cable from the keyer out of the way.

Thanks, Paul K9OT

I have found the quality of the 3.5mm jack to be less than great. Takes a bit of a wiggle at times to make it work.

Easy to drive. Big knobs. Intuitive for the most part. One does not have to keep running to the manual!

I agree with Richard -

The Orion is easy to operate, and the menu system is pretty much a "set-and-forget" system. The most often used adjustments are covered by knobs (and a few push-buttons) on the front panel. The second receiver is a big plus for split operation, diversity reception, or for general coverage/broadcast listening - should you be so inclined.

Prices on used Orion's are hard to beat, considering the level of performance you will have. One thing I would recommend is that you buy one with the built-in tuner. Mine does not have this feature, but it works well with my outboard LDG AT-200Pro Autotuner. It's just a little inconvenient to have the Autotuner in a separate box.

My only objection is the choice of font used on the main screen. It's boring, but that's only a cosmetic issue. The main thing is that the radio really performs!

Hope this helps -

Paul,

The Orion is not a formidable radio. It is versitle.
I appreciate the ergonomics of the radio. Look at a picture of the front panel. Imagine turning the left most VFO knob (A) with your left big finger. Upon hearing a station, use your pinky finger to hit the "spot" button for zero beating as you continue to adjust the VFO knob (only one hand is required).

If the incoming signal is too loud, hit the "preamp" or "rf gain" buttons with your pinky finger or just above the VFO knob is the AF gain.

If you wish to tune at a faster rate, the "step" button is also within reach of your pinky, or hit the "main RX" button with your index finger.

Notice, too, the location of the "AGC" next to the AF gain knob. You may easily jump through four settings to adjust to signal and band conditions.

I often have two keys plugged into the radio using whichever suits my fancy or situation.

That covers about 90% of my turning and pushing activity.

The radio is so big that if I am excited, pushing a button will not send the radio onto the floor !

Paul,

Is the STEREO plug wired properly ?
Is the STEREO plug inserted completely ?
The "SP" button on the front panel must be off for manual keys or using outboard keyers.

I have keys plugged into both outlets simultaneously. They work just fine.
Good Luck.

Hi Paul. Well, I DID spend my money on something else for a long time, having owned higher-end rigs from Elecraft, Icom, Yaesu, Kenwood. I acquired my first TenTec transceiver (Orion II) just this past May after a disastrous episode with an FTDX-5000. I'm definitely NOT a TenTec bigot and didn't really expect much from the Orion. I feel that today's operators place far too much emphasis on the Sherwood IMD rankings (which they don't really understand) and give almost no consideration to all the other design issues.

With that as background, I've been pleasantly surprised with the Orion II, especially in the area of ergonomics. The overall design of the front panel and menuing system is very good. As with some of the Icom rigs with menus (Pro III for example), most of the menu items are visible at the same time, but the Orion takes it a step further in grouping menu items by subject (CW, RX, TX, etc). Anyone who has experienced the convoluted menuing of the K3 will really appreciate the time and effort that went into the Orion II design.

There are some areas that are a bit of an irritation and the Orion designers should have perhaps borrowed more from the best ideas of Icom and Yaesu. For example, the automatic antenna tuner has no memories so it can't retune to a past frequency without putting a carrier on the air. That's just nuts. The elaborate AGC system which allows you to tailor every conceivable AGC parameter is just great for those of us who do weak signal CW work on 160M, but why expose all that complexity to every user? Thank goodness, the factory defaults work just fine for all modes.

Related to the AGC design is the RF Gain control. In most cases, the right setting for that control begins at a value around 70 (but the max value of rotation is 100). If you run the gain wide open as you can easily with most other high-end rigs, you'll be VERY unhappy with what you hear. You can indeed easily change the tuning step size with a couple of button presses, but on a state-of-the art rig, why should you have to do even that?? Implementing a variable rate tuning system is rather simple today and I have that even on the VFO I built for my Drake TR7.

Some other functions I use frequently on the Orion involve two steps where they are a single step on other rigs. For example, changing the output power level - on the Orion you have to hit the PWR button and then turn the Multi knob to set the power. Same with keyer speed, monitor level, sidetone level ,etc. It would be nice to have a single control dedicated to some or all of those functions.

The assignment of VFO A or B to the TX, RX and/or sub-RX is another area where the Orion differs from the Japanese rigs and can be confusing. It's much more flexible than the other rigs - via dedicated buttons you can assign either of the two VFOs to any of the three functions. There is no SPLIT button. Until you become familiar with the odd operation, you'll make mistakes on that for sure.

The Orion's sweep function is of little value except to see if there are signals on the band. But, the fact that the Orion has a 9 MHz first IF makes it relatively simple to add a REAL external panadaptor that interacts with the Orion via software.

Overall, I think the Orion gets the major stuff "right". If you're a CW person, rest assured that the Orion is as good as or better than anything else out there. The keying waveforms are near perfect and the controls for varying the waveform characteristics actually work. No clicks, no short dits, etc.

On the other hand, if you don't really need the extreme performance of the Orion, the IC-7600 might be more than adequate for your needs. The fact that it has a reasonable bandscope is a big plus and with the roofing filters, the IMD performance should be plenty good for just about any situation. And - it covers 6M.

I looked carefully at the Eagle recently and decided it would be a good possibility for a portable rig due to the physical size. If that's what you're after, it would probably be a better choice than some of the recent Icom rigs.

At any rate, the Orion II is the first transceiver I've had in a long time that I'd judge as a long-term keeper. It would have been nice to have 6M built in, as well as the interface for an external panadaptor.

Floyd makes some really good points, but a few specific in-line responses:

> Anyone who has experienced the convoluted menuing of the K3 will really appreciate the time and effort that went into the Orion II design.

The K3 is hamstrung by its small display and would be unable to display the category menu selection of the Orion, which is quite advantageous.

> There are some areas that are a bit of an irritation and the Orion designers should have perhaps borrowed more from the best ideas of Icom and Yaesu. For example, the automatic antenna tuner has no memories so it can't retune to a past frequency without putting a carrier on the air. That's just nuts. The elaborate AGC system which allows you to tailor every conceivable AGC parameter is just great for those of us who do weak signal CW work on 160M, but why expose all that complexity to every user? Thank goodness, the factory defaults work just fine for all modes.

There's a lot of lingering misinformation on the alleged necessity to finely adjust the Orion's AGC parameters. The K3 has similar settings but bury them in a deeper level of menus (CONFIG).

> Related to the AGC design is the RF Gain control. In most cases, the right setting for that control begins at a value around 70 (but the max value of rotation is 100). If you run the gain wide open as you can easily with most other high-end rigs, you'll be VERY unhappy with what you hear.

I don't know about "most other high-end rigs". The K3 is virtually identical in its need for RF Gain throttling. It just seems logical that to optimize AGC performance and to lower background noise, you need to use the appropriate degree of gain. This holds true on all the myriad vintage radios I own/use.

> The assignment of VFO A or B to the TX, RX and/or sub-RX is another area where the Orion differs from the Japanese rigs and can be confusing. It's much more flexible than the other rigs - via dedicated buttons you can assign either of the two VFOs to any of the three functions. There is no SPLIT button. Until you become familiar with the odd operation, you'll make mistakes on that for sure.

I disagree on "for sure" mistakes - from day one, I understood the elegant simplicity of the Orion's vfo/antenna assignment button matrix - sheer perfection.

> On the other hand, if you don't really need the extreme performance of the Orion, the IC-7600 might be more than adequate for your needs. The fact that it has a reasonable bandscope is a big plus and with the roofing filters, the IMD performance should be plenty good for just about any situation. And - it covers 6M.

The IC-7600 is an up-converting design with 3Khz roofing filters.
That's not going to be "plenty good" on low band cw.

Hi Barry. I'll respond to just two of your comments:

First:
"The IC-7600 is an up-converting design with 3Khz roofing filters.
That's not going to be "plenty good" on low band cw."

The Icom IC-756 Pro III is also an up-converting design and the Inrad roofing filter I installed there was measured by others at around 5 KHz as I recall. Regardless, I had no problems beating out the K3 and Orion owners in my area in the 160 CW contests and CW Sweepstakes with the Pro III. Things might be quite different in One-Land with many more strong signals close-by, but the 5 KHz roofing filter tamed the IMD problems in the Pro III quite nicely and IMD was a problem prior to that for me on 20 and 80 CW.

There's no doubt that the Orion II is far better in preventing IMD problems with its narrower roofing filters. But since 99.99% of today's operators wouldn't recognize the symptoms of IMD problems if it bit them, I maintain that the IC-7600 is "plenty good" in that regard.

Second:
"There's a lot of lingering misinformation on the alleged necessity to
finely adjust the Orion's AGC parameters."

Agreed. But, just last week, I finally encountered a situation where manipulating the AGC threshold on the very weak 160M signal of ST0R made the difference between copy and no copy. For the average Orion user, he'll likely NEVER run into a situation where twiddling the AGC parameters will be of much value.

73, Floyd - K8AC

Sounds like you did a good job finding the sweet spot for pulling him out.
But you can also change AGC threshold by simply adjusting the RF Gain
control - see
http://groups.yahoo.com/group/orion565/photos/album/1849118754/pic/116912970/view?
for a graph of how they're related in the later firmware. Personally, I
turn AGC off (with high AF Gain and low RF Gain) when I operate cw on the
Orion - I prefer to maximize, rather than compress, the dynamic range.

Before you upgrade, do you have a computer logging program talking to
the Orion? I'd try and get that working first. Port settings are:

57600 baud, no parity, 8 data bits, 1 stop bit, handshake DTR, handshake RTS
(Icom code 4, if that's a setting)

Yesterday we installed the latest version in my Orion. It had V1372 or something like that (dont remember).

I have a fencer that runs 365 days a year. The old version hardware blanker took care of the fencer.

The new one does not. The only way I can blank it out is to run the hardware blanker and the other one up all of the way.

Is this an issue with this version or just on my radio?

Other than that, so far I am very happy with it. I just need to figure out all of the best settings.

Thanks,73

I have a fencer that runs 365 days a year. The old version hardware blanker took care of the fencer.

The new one does not. The only way I can blank it out is to run the hardware blanker and the other one up all of the way.

Is this an issue with this version or just on my radio?

Other than that, so far I am very happy with it. I just need to figure out all of the best settings.

Thanks,73

Paul K9OT

Hi Richard, since I had never run an Orion before I do not know what is best. I am mostly a CW op with a little SSB when CW is slow. Mostly DX with a little contesting sometimes.

In the winter I am on 160m almost every night. So that will be the test.

I had an Omni VI+ with the Inrad 600hz roofing filter. It works very well, but a bit noisy on rcv. My Corsair II I can back off the RF gain and get rid of the noise just before I loose the signal. The Omni VI+ is not as good in that respect.

As far as versions and which one is best, I do not have enough experience to know which one is best. I am making contacts, so I am hoping that a little experience will help.

Orion II with 300HZ, 600HZ and 1.8Hrz filters. Remote encoder included, 712 Sound Card and a near new (use a few time) TenTec 707 mic in the original case. Unit is in very good condition just a few scratches on the top of the case (pictures available) Original 'Goodies Bag' included with all original accessories. The only items used from the bag are the power cord and the Din to multi-RCA cable and both will be included with the sale. Priced at $3300 for ever thing plus actual UPS shipping charges PayPal OK

Paul, if you can I suggest sticking with v2.064x11 for now because it will
be the basis for the next firmware release with further improvements.

Paul,
I have a fencer about 40 feet from my antenna.

I am not successful in completely eliminating the
pulses. You should experiment with your AGC settings.
I use the high and low cut as well as the hardware blanker
and some software blanking and make it quite tolerable on
local SSB. I'll have to try it on CW. Of course the AGC can do a
job on you for DX, desensitizing the receiver. Have you tried turning
the AGC off and using a very narrow bandwidth?

Fortunately the fencer should be turned off for the winter (160) season.

I have been having a problem with the DC connector on the Orion 2. Over the
past year, I have had to remove the DC plug and clean the contacts as best
I can. this seems to work for several months. It seems like that
connection is not big enough to handle the current that the Orion uses. It is a pain
to have the rig drop out in the middle of a QSO. Ten Tec sent me a new
Male and Female connector and I changed that last year but it is happening
again. Has anyone experienced this problem and if so how did you correct it.

Art,

The hole in the bottom of the Orion is a hardware microphone adjustment pot. There is not a hole for the LCD. The LCD adjustment is located below the MAIN AF knob but you must remove the bottom enclosure panel. I was having trouble with mine and when I had the bottom off, I drilled a small hole to access the adjustment.

73,

John

Look at the inside of the plug for burnt looking marks. The female contacts will widen and will arch when in transmit. My O1 would reboot during a qso. At the time mine was doing this, 2-3 years ago, TT said "We've never heard of this problem before." well there were several on here that had the same issue and contacted TT. VERY CHEAP CONNECTOR on such a good rig. That being said, what I did was take the connector off the board and hardwired a power connection directly. What I would do now is mount a power pole connection if possible. The Eagle now has that and that's better

Good luck

I also had this same problem, not only on my O2 but on most of the ICOM equipment that I have. My fix was to make my own cords. I used HD quick disconnects that can be found at Radio Shack (for now). I'm sure there are other fixes you will hear about, some better perhaps, but I've had no problems since installing these. Make sure you fuse the positive lead.

The ones I used are similar to these.
http://www.radioshack.com/product/index.jsp?productId=2103449
When finished, the cords look like these;
http://qsradio.com/7000%20Power%20Cord.jpg (or you can just purchase the pre-made cords)

There was a discussion thread on here recently where someone put PowerPole connectors on.
That seems to me to be the way to go.

Photos and instructions are available on the Orion Yahoo Group website.

I wrote up the conversion to PP and can be found in the TT Wiki under 565 with photos.

Basically, remove the connector from the board,

purchase the PP and their PCB pigtail and plate.

My webpage was removed by ATT as they don't support Prodigy after

having it their for 10 years, bummer

The Eagle was the inspiration. I have also done my Jupiter.

No problems as of yet.

Art,

I sent my Orion to Ten-Tec for a repair and then almost traded it for a new Omni VII, but I was told I had to buy a new case since I had drilled a hole in the bottom. I decided just to keep the Orion and the hole is still there. I was interested in using the VII via the internet. But I found that I really could do without that. So I am still running the Orion which is now about 8 years old and does an excellent job for me.

If I could get a couple of annoying problems fixed with my Orion, I'm sure I would really enjoy it. After all, I grew up in and around Sevierville so I'm really trying to make it work out for me as well. I have used an Omni VII on a couple of occasions and really liked it too, but I found this orion used at a great price and thought I'd try it out and I'm glad I did. It looks good sitting next to my Drake twins that I got new in high school in '69. I do wish TenTec had better documentation though. Their schematics are awfully hard to follow. But, that's a nit.
Our Huntsville Hamfest is this weekend and I am the dealer show chairman. So I'll see the Ten Tec guys tomorrow as well as Scott Robbins W4PA, now the owner of Vibroplex. He knows more about the Orions than anybody at Ten Tec now, with the possible exception of John Henry.

Hello,
I am going to use my Heil PR40 mic with my recently aquired Orion I. I see a reference to a Mic Plug Mod in the achrives .What is the Mic Plug Mod? Thanks in advance

Lanny N0JZ

7077. Orion I with signal link USB for PSK31 need config help!!! Receives but no xmit

Yahoo group: orion565 (2009 — 2013)

Hello gang, i am trying to setup my Orion I to run psk31 via a signal link USB into DM780. I have the thing working enough that the program can hear and decode sigs but when i xmit all it does is key the xmiter but there is no output. Can anyone point me in the right direction. the Orion manual is of little help or else i am looking in he wrong place.

Thanks & 73,

Grant / W5XJ

You are using the front mic connection or audio input on the back aren't you? The go to MENU then SSB select TX AUDIO SOURCE change that from mic to AUX..should be ok.. PLUS on the SSB menu you might have to bump your AUX INPUT GAIN to 10-14 also

Good luck

John

Double check the SL USB procedures on your mixer setup (selecting the SLUSB) à USB AUDIO CODEC

Here is my O1 Settings for using the SLUSB

On the front of the Orion

SP 6

MENU à SSB à AUX INPUT 14

TX AUDIO SOURCE AUX

IN DM780

In the WATERFALL screen select OPTIONS à Left menu select SOUNDCARD à OUTPUT TRANSMIT should indicate USB AUDIO CODEC and SOURCE is WAVE

Might be some things to check out

John

Same problem here. Make sure that you can get audio in via the front mic connector (don't forget to switch back to "mic" as input in TX menu). You might have to turn up the mic gain until you get some ALC action (red light). If this works, chances are your AUX-IN circuitry is dead (like mine).

Hello Art, I will call Paul Monday at TT. I can't use the mic instead i bought a connector that is supposed to work with the I/O in the back of the rig. I'm sorry yours is dead, i hope mine is OK. It is a real pain, this went much faster and better with my 4-5 year old KW TS-480-HX. If the TT is this big a pain i will switch digi over to my 706MKIIG as it uses the same plug as the TT.

I wish one of you TT digi guru's would post a PDF guide to PSK31 in the files section to help us newbies out.

Thanks and 73,

Grant / W5XJ

In tuning any grounded grid amp, the amplifier tuning is reflected back to the input which in turn will be seen by the radio. Yes, with my radios and my GG amp I see the same thing.

Nothing to be concerned about, everything is normal.

Experienced this too.
Became much less when I added more radials to my vertical antenna.
I have waaaay too short radials. but it is wat it is in my (30x25)puny backyard.
And it went almost totally away when I added a common mode filter with 5 windings coax through a set of 5x FT240-31 toroids at the shack entry wall.

Hi group.
I find on one of ebay auction somebody said he is using color LCD from Omni 7 in Orion 1.
This is the link http://www.ebay.com/itm/LCD-Display-Ten-Tec-Orion-1-Transceiver-/180718871881?pt=LH_DefaultDomain_0&hash=item2a13af2549 .
Anybody have any expirience with this mods.Is this possible?

Thanks

I had an email chat with the guy about that. The replacement screen was from a Jupiter, not the Omni 7, so he got the better blue color, but still a monochrome screen from that radio.

As I read the advertisement he offers the original black / white LCD screen he just replaced by a blue / white screen.

The jupiter has a blue/white screen but as far as I know it is smaller size. My guess is that the HAM replaced the original with the orion blue/white replacement screen.

The replacement blue/white has different specifications / timing needs and as such does not operate optimal.

Another improvement is reducing the back light current from 220mA to around 115mA. Pixel saturation will be thing of the past as well the newer LCD screen are designed to operate around 120mA...

Anyway, it seems worth buying a replacement just in case :-)

7091. How do I adjust the Filter C F?

Yahoo group: orion565 (2009 — 2013)

Topic: 7091 Message: 7091

I have not yet messed around with adjusting the C F of the filters in my O1. I operate 90% CW, and use the filtering extensively.

So, the question is; what method do I use to adjust the Filter C F for optimal operation?

Thanks for the help.

I'd tune the Orion to an empty spot on the band, feed the rx audio into a soundcard and run spectrum analyzer software and check for a deviation between center of displayed filter passband and the sidetone frequency set on the Orion.

You are correct, sir. I had a note from Paul Clinton at Ten Tec who said the screens in the Omni 7 and Jupiter are not compatible with the Orion. Also, they can no longer get the original black and white screen, but they have the blue screen which they sell as a replacement, not an upgrade, since they don't consider the quality of the replacement to be quite as good in this application.

hi,
i'm looking for a panadapter on my orion and i'm reading the
rick's documents for z10000 buffering amps setup but
i see: " this procedure has not been approved by ten tec inc".

http://www.ve7tk.com/9MHz_IF.pdf

What is the problem with this mods?
There are other mods approved by ten tec ?

Thanks and good DX

Call it cockpit error in the past or learning curve

It takes a time to learn a rig but I have to admit that the Orion II is either getting wiser or the operator

I am adjusting the DSP and the filtering to such a point that I can pull out the weak stations to a point that I am able to work and hear things fine

Whether if it is in a pile-up or a weak signal the Orion II is performing amazing

My totals have shot up dramatically but then again I am on a lot

After comparing notes with VO2FF - Daniel I have made adjustments that really work
Also the Orion table for setting have greatly made a diff

7097. Orion 565 (1) blue / white replacement lcd

Yahoo group: orion565 (2009 — 2013)
Date: 2011-09-11 16:40:06 UTC
From: pa1ap
Topic: 7097 Message: 7097

Greetings,

I am looking for a few hams who want to help designing the LCD logic to make the blue/white lcd screen working correctly. I am going through the timing diagrams as provided by the vendor and I wrote the inital code to read, store and write the bit status between CPU and LCD. Since I do not know the root cause of the problem some trail and error might be needed to arrive at correct transformation. For this it would be good to reflect thoughts and idea's. Anyway, if you are interested drop me an email.

73, Onno de pa1ap

Simone I always put this note on any modifications I prepare for public distribution. It is to let you know that I did the modification, I did not consult with Ten-Tec, and so do not call Ten-Tec if you have questions specific to the modification. (It is my understanding from reading this reflector that Ten-Tec will do a portion of the mod bringing the 9MHz IF out to the SPARE jack allowing the user to add an external version of the Z-10000 buffer. To do this you would need to send the Orion back to the factory.)

As to whether there are any Ten-Tec approved modifications. The answer is YES. For the Orion 565 there is the Version 2 "Logic/DSP" modification, the "Orion FSK Operation" (for early models of the 565) and the Argonaut V "Field Modification of Ten-Tec model 516 Argonaut to Reduce Potential of SSB TX Distortion" to name a few.

73,
Rick - VE7TK

From: Earl
Topic: 7088 Message: 7099

Greeting All,
I replaced my old screen for a new blue one. I love it. It is better than the old screen by far. I also replaced the RAM lithium battery and all 3 470mfd caps on the power distribution board. Super new life to my old OI i bought in 2004.

Regards,
Earl, K5FTE

Art were you able to get TT to repair the dead Aux-in? I spoke to Paul and Stan and they did not have a fix. Tiger asked me to check continuity on the pins so I'll do that. How did you figure out your aux-in was DOA?

Thanks & 73 de w5xj

I found it out when I tried to feed the audio from my Signalink USB in to the AUX-In jack on the aux-I/O cable and could not get any response. I tried adjusting the gain, made sure I had selected either AUX or BOTH for audio source, etc...

Finally I checked continuity from pin 1 of the AUX I/O DIN jack on the rear panel all the way to U200B, pin 2, board A7 where the signal enters the world of digital. That checked out OK. That chip has several audio functions which all work fine. All this is shown on the schematic of board A7, pages 3 and 7 and board A12 J3 if you're inclined to chase it down yourself. It is carried to the A7 board in coax cable #24.
So I'm back where I started. I'm too cheap to pay TT and FedEx to chase down a gremlin until I'm absolutely sure I NEED that function and I've exhausted all my knowledge (doesn't take long for that!) As an alternative, I just feed the audio in to the front panel mic input. Works just fine.

Good luck!

From: w5xj2011
Topic: 7077 Message: 7104

Last night i got mine to xmit off & on but not well at all. It also hung up in XMIT a time or two with no output shwing on the meter. I had all the gains (orion & SLBUSB) up to the max which is not necessary on other radios and got a little to show on the power meter.

I might try the mic input to see if that solves my problem. What cable did you buy to run the SLBUSB off the mic input? Are you running windows 7 on your computer?

Many thanks for the suggestions!

Topic: 7077 Message: 7105

It's just a regular 4 pin mic connector to the radio and an RJ45 (ethernet) connector on the SL.Both available at Radio Shack. But I just took an internet cable and cut one connector off and replaced it with the 4-pin. Make sure to check the continuity from the new connector all the way back to the jumpers to make sure you have everything wired the way you intended. You can wire it with or without the PTT hooked up and use VOX if you want. I personally like having the PTT holding the XMTR in though.

If you didn't show any ALC (red light) then you didn't have enough audio. With digital modes you want to turn the gain up until the red light comes on and then back off just until it's not lighting up. That will keep the signal clean.

Subject: [orion565] Re: Orion I with signal link USB for PSK31 need config help!!! Receives but no xmit

Last night i got mine to xmit off & on but not well at all. It also hung up in XMIT a time or two with no output shwing on the meter. I had all the gains (orion & SLBUSB) up to the max which is not necessary on other radios and got a little to show on the power meter.

I might try the mic input to see if that solves my problem. What cable did you buy to run the SLBUSB off the mic input? Are you running windows 7 on your computer?

Many thanks for the suggestions!

>

> I found it out when I tried to feed the audio from my Signalink USB in to the AUX-In jack on the aux-I/O cable and could not get any response. I tried adjusting the gain, made sure I had selected either AUX or BOTH for audio source, etc...

>

> Finally I checked continuity from pin 1 of the AUX I/O DIN jack on the rear panel all the way to U200B, pin 2, board A7 where the signal enters the world of digital. That checked out OK. That chip has several audio functions which all work fine. All this is shown on the schematic of board A7, pages 3 and 7 and board A12 J3 if you're inclined to chase it down yourself. It is carried to the A7 board in coax cable #24.

> So I'm back where I started. I'm too cheap to pay TT and FedEx to chase down a gremlin until I'm absolutely sure I NEED that function and I've exhausted all my knowledge (doesn't take long for that!) As an alternative, I just feed the audio in to the front panel mic input. Works just fine.

I am having this exact problem with my Orion II and a new Signalink USB. I am using the cable provided by Signalink to my Aux I/O Port (8 pin). I have tried setting the TX Audio Source to AUX, increasing the Aux Input Gain all the way to max (100), increasing the H/W Mic Gain to max, increasing front panel MIC gain to max and turning on the SP and setting it to max. There is no ALC indication and no audio out, the transmitter goes into transmit when trying to send. I would hate to think that I will have to use the front panel mic jack to get this working.

To Grant and others. I do notice on page 11 of the Signalink Troubleshooting section it talks about "Special Jumpers" to install at JP3 which will dramatically increase the Signalink's transmit audio level. Perhaps this is work a shot.

Should not have to crank up the AUX INPUT to max.. mine is sitting on 13 and is fine, the front SP set at 6 .This is on my O1 BTW

Have you checked your cable to make sure it's good

Good luck

ALSO just for giggles and grins, might try a BATTERY FAIL reset and then a "regular reset" . Never know!!

This is getting fishy! Three of us (any more?) having the same exact problem? I do have the jumpers configured to provide the higher output level, although on paper it shouldn't need it. But I'm starting to wonder if there isn't something we're missing here. I opened my Orion back up this weekend and did some more signal tracing. I was able to confirm signal all the way to the point where there were other functions that shouldn't be working but that are, except for AUX-IN. I look at the audio going in on my o-scope and it looks normal, about 1 V p-p, with the gain at 100 and - nothing!

I have a couple of friends here in town with Orions and sounds like I need to make a visit to them with my SL and cable and try them. Right now I'm starting to have trouble blaming the radio.

Add one more to the growing list. I have a new Orion II and am having the same problems. I have the rig working with both DigiPan and RMS Express to run PSK31 and WinMor using the Ten Tec #721 USB sound card, but can not get it to work with the SignaLink. In HRD sound card setup it shows the card with wave on the send, but is blank on recieve where it should show line in.

I have a long email from Tigertronics that lists some things to try, and will be working on this today. If that fails, I will call Jason at Tigertronics to discuss further and possibly return the unit.

Also, for those of you who want to run WinMor for your local ARES group, there is a new version of RMS Express coming out that will interface with all Ten Tec radios. The current version did not list Ten Tec as a selection. I got the test version from one of the developers last night, and it works great with the Orion.

I will be very interested to hear how the tests go using the Tigertronics list. If you can I would appreciate seeing the list - my email is n9aw at sbcglobal dot net.

I will also be double checking the Tigertronics supplied cable tonight.

Finally, I have 2 alternatives I can use to check this a bit more. I have an Omni 7 so can check the Signalink on there (uses a different cable to a 5 pin din). I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

my Orion back up this weekend and did some more signal tracing. I was able to confirm signal all the way to the point where there were other functions that shouldn't be working but that are, except for AUX-IN. I look at the audio going in on my o-scope and it looks normal, about 1 V p-p, with the gain at 100 and - nothing!

I have tried setting the TX Audio Source to AUX, increasing the Aux Input Gain all the way to max (100), increasing the H/W Mic Gain to max, increasing front panel MIC gain to max and turning on the SP and setting it to max. There is no ALC indication and no audio out, the transmitter goes into transmit when trying to send. I would hate to think that I will have to use the front panel mic jack to get this working.

Just to double check;

On Orion 566 (2) please ensure you include a capacitor to decouple from the DC signal on the audiopin. This has been reported by Peter OZ1PIF a while back. Fro whatever reason TT forgot the decouple the AF signals from DC and you will find +5VDC on the audio pin. This DC voltage saturates the transformer causing very poor audio transformation.

For me the signalink works great. Cheers Onno de pa1ap

Hi Jerry,

I can help with the din connector.
The 712 ships with a 5-pin din, as you are aware.
These 5 pins match the "top 5" pins on the 8 pin din labeled AUXIO on the Orion II in function and form factor.
No adapter necessary.
Just ensure that you place the indented metal key on the collar of the 5 pin din of the 712 into the 8 pin din slot where the key should go.

Good Luck,
John Henry

I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

Thank you very much John, I will try this tonight with my TT712 to see if it will work with my O-2. I wasn't sure if the 5 pin DIN would physically mate to the 8 pin socket but it sounds like it should.

OK, breaking news! I just tried (for the 50th time) to put audio from a signal generator (my TS-940 with the calibratpr on) into the AUX-IN connector and it WORKS. I don't know why it worked, but it did, and still does. With the AUX GAIN set at 20, it trips the VOX with ALC light on with about 1.5 Vp-p audio level going in. With a gain of 15, it takes about 2V p-p. So it now appears to be working. I know that my SL-USB only puts out about 1V p-p which would explain why it never tripped the VOX. The input sensitivity of the AUX-IN is listed as 6dbm (1.5 V), where the mic input is 5mv for full output.. Way more sensitive than the AUX-IN port.

OK, breaking news! I just tried (for the 50th time) to put audio from a signal generator (my TS-940 with the calibratpr on) into the AUX-IN connector and it WORKS. I don't know why it worked, but it did, and still does. With the AUX GAIN set at 20, it trips the VOX with ALC light on with about 1.5 Vp-p audio level going in. With a gain of 15, it takes about 2V p-p. So it now appears to be working. I know that my SL-USB only puts out about 1V p-p which would explain why it never tripped the VOX. The input sensitivity of the AUX-IN is listed as 6dbm (1.5 V), where the mic input is 5mv for full output.. Way more sensitive than the AUX-IN port.

Yes, the jumper JP3 has been in place through all this. But the best I can get out of the SLUSB is 1.4 Vp-p which is not enough to trip the VOX on the Orion. However, after wiring up the PTT the radio goes into transmit and with a AUX GAIN set between 30-40 I get full power out now.

I hope the others of you have your problem to magically disappear as well. I'll be scratching my head over this for a while to come.

Good thinking. I know it shouldn't matter, but a lot of things change when a different version is installed.

Subject: RE: [orion565] Re: Orion I with signal link USB for PSK31 need

config help!!! Receives but no xmit

Yes, the jumper JP3 has been in place through all this. But the best I can

get out of the SLUSB is 1.4 Vp-p which is not enough to trip the VOX on the

Orion. However, after wiring up the PTT the radio goes into transmit and

with a AUX GAIN set between 30-40 I get full power out now.

I hope the others of you have your problem to magically disappear as well.

I'll be scratching my head over this for a while to come.

The unit has provisions for increasing the transmit audio to 2v P-P at 600 ohms

I think it is jumper 3.

OK, breaking news! I just tried (for the 50th time) to put audio from a signal generator (my TS-940 with the calibratpr on) into the AUX-IN connector and it WORKS. I don't know why it worked, but it did, and still does. With the AUX GAIN set at 20, it trips the VOX with ALC light on with about 1.5 Vp-p audio level going in. With a gain of 15, it takes about 2V p-p. So it now appears to be working. I know that my SL-USB only puts out about 1V p-p which would explain why it never tripped the VOX. The input sensitivity of the AUX-IN is listed as 6dbm (1.5 V), where the mic input is 5mv for full output.. Way more sensitive than the AUX-IN port.

help!!! Receives but no xmit

Thank you very much John, I will try this tonight with my TT712 to see

if it will work with my O-2. I wasn't sure if the 5 pin DIN would

physically mate to the 8 pin socket but it sounds like it should.

> > Finally, I have 2 alternatives I can use to check this a bit more. I have an Omni 7 so can check the Signalink on there (uses a different cable to a 5 pin din). I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

7121. Re: [orion565] Re: Orion I with signal link USB for PSK31 need config help!!! Receives but no xmit

Yahoo group: orion565 (2009 — 2013)
Date: 2011-09-23 05:45:46 UTC
From: Jerry, N9AW
Topic: 7077 Message: 7121

Art,
Thanks for the update. I am going to install that jumper tomorrow and see if it will work with the Aux Gain cranked up a bit. I need to get something going before the CQWW RTTY contest which starts Friday evening. I am not in it for a big score just want to get back to RTTY and cross the DXCC threshold (86 worked now). Haven't been on RTTY for around 10 yrs, having a ball.

73
Jerry N9AW

Jerry

I sent you their list, but here it is for everyone else:
Ten-Tec Orion Setup
==========
RX Audio - The "Audio" menu determines what audio is available on pins 4 and 6, so the SignaLink's SPKR jumper will need to be set accordingly or you'll have no Rx Audio.

MIC GAIN CONTROL - This control will have no affect on the SignaLink, so you should be adjusting the "Aux Input Gain" control instead. This will affect your power output (see below)

AUX INPUT GAIN - Set this control at 75 to start, and turn it up higher if you still have no power out.

TX AUDIO SOURCE - This must be set to AUX.

TRANSMITTER - This must be set to ON, or the transmitter will be disabled.

RF POWER - Set for 100 watts. Once things are working, you will adjust the SignaLink's TX knob for the desired power output. You can lower the RF Power if the TX knob adjustment is touchy.

VOX - OFF

TX FILTER BANDWIDTH - I don't think this can be set narrow enough to get you into trouble, but 2.7Khz is the recommended setting.

KEYING LOOPS - Unless you have an amplifier connected, these should be OFF.

> Finally, I have 2 alternatives I can use to check this a bit more. I have an Omni 7 so can check the Signalink on there (uses a different cable to a 5 pin din). I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

Good luck, hope it works out. Otherwise you can always use the mic input till u figger it out (don't use the JP3 jumper though!)

Art,

Thanks for the update. I am going to install that jumper tomorrow and see

if it will work with the Aux Gain cranked up a bit. I need to get something

going before the CQWW RTTY contest which starts Friday evening. I am not in

it for a big score just want to get back to RTTY and cross the DXCC

threshold (86 worked now). Haven't been on RTTY for around 10 yrs, having a

ball.

73

7124. Re: Orion I with signal link USB for PSK31 need config help!!! Receives but no xmit

Yahoo group: orion565 (2009 — 2013)
Date: 2011-09-24 08:18:56 UTC
From: pa1ap
Topic: 7077 Message: 7124

In case of 566; take a DC voltmeter and measure on the audio pins if you detect +5VDC... if so, you know you need to include a series capacitor to avoid transformer saturation....

>
>
> OK, breaking news! I just tried (for the 50th time) to put audio from a signal generator (my TS-940 with the calibratpr on) into the AUX-IN connector and it WORKS. I don't know why it worked, but it did, and still does. With the AUX GAIN set at 20, it trips the VOX with ALC light on with about 1.5 Vp-p audio level going in. With a gain of 15, it takes about 2V p-p. So it now appears to be working. I know that my SL-USB only puts out about 1V p-p which would explain why it never tripped the VOX. The input sensitivity of the AUX-IN is listed as 6dbm (1.5 V), where the mic input is 5mv for full output.. Way more sensitive than the AUX-IN port.

Topic: 7077 Message: 7125

Good news - I think. The Tech from Tigertronics called late yesterday and we went through the setup. I explained that I had the rig working with HRD, DigiPan, and RMS Express with the 712 dongle, but couild not get it to work with the SignaLink. Maybe I am dense, but a few of their steps in the setup are not as clear as they could have been. That said, after about 15 minutes we had it working perfectly. I doubt that I will use HRD very much because it had too many options for my needs. I will do a little PSK31 using DigiPan and use RMS Express for WinMor ARES communications.

Now to go make screen shots of all of the places we made setting changes so when it screws up or I have to reconnect it to the XP maching I will have a record of what we did. Or I can just go back to the 712 which is true plug and play.....

I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

I have the rig working with both DigiPan and RMS Express to run PSK31 and WinMor using the Ten Tec #721 USB sound card, but can not get it to work with the SignaLink. In HRD sound card setup it shows the card with wave on the send, but is blank on recieve where it should show line in.

But I'm starting to wonder if there isn't something we're missing here. I opened my Orion back up this weekend and did some more signal tracing. I was able to confirm signal all the way to the point where there were other functions that shouldn't be working but that are, except for AUX-IN. I look at the audio going in on my o-scope and it looks normal, about 1 V p-p, with the gain at 100 and - nothing!

Hi Gang,
I wonder if anyone is using a Heil PR-30 or PR-40 with the Orion II and not using an outboard EQ like the W2IHY 8-Band. I tried using the on board EQ with the PR-30 but it apparently doesn't have the range to deal with the flat response of the professional mic's. I have a basey voice and everyone says I sound "Mushy". The Heil HC-5 cartridge sounds great as does the TT 709 which I use most of the time. Am I missing something here?

Thanks
73
Tony - W9JXN

Hi, Tony! I am using the Heil PR 40 microphone and running it through the W2IHY EQ Plus and the 8 Band Equalizer. I have a really low voice and I found that I had to really pump up the highs on the 8 band....the last four sliders (the higher frequencies) are just about at max. I had some of my buddies listen to me on 80 meters and got me dialed in. When I listen through the Sony MDR v6 headphones on monitor mode, I listen at about 40%. You can really tell when certain frequencies are changed. If you listen through the back end of the outboard EQ, you don't really get what the transmitted audio sounds like. When I first got the Orion II, the reports I got on transmit audio were that my signal was "mushy", just like you are experiencing. The PR 40 did not sound good without outboard EQ. So, my "cure" was to turn the highs just about to max. With the outboard EQ, I am running the microphone gain at about 30%, because if I hit it harder the ALC does not like it.

I am running the transmit bandwidth at 3800 and I am getting some really good reports on the audio. One response was that it sounded like "broadcast" quality. I am not an ESSB nut, but guess I'm getting close! Hope this helps.

73, Ralph, NA6D

Did you try running Orion TX EQ at -15 to -20dB to roll off your lows?

"Going straight to the O2" sounds like you're rolling them off external to the O2. Your first step should be to bypass all external equalization and adjust the Orion's TX EQ setting for best treble/bass balance and only then start fiddling with the external EQ.

Hi Ralph et al.

I was using the Pro-30 straight in for some time, and the guys on 3737 liked it . I don't have a lot of lows in my voice. I replaced it with a Shure 55 series II and since the guys liked that better, I now have a pro-30 for sale in original box.

73,

Andrew

Ah! Thanks for the idea Andrew and the rest of the guys that
responded. I do have a 55-SH and I will see what that one sounds like.
I have used the PR-30 with the Omni VII but got the same results. I
have the 8-band EQ but would like to eliminate the outboard stuff as
much as I can because I'm running out of space. Hmmmmm....I wonder if
more control could be provided with a software revision. Just a thought.

Gentlemen: Good stuff. Because of the wide frequency response curve on these Heil's, they absolutely do need to be tweaked when used for SSB. I remember the days when I had a Shure 444 and it was tailored for communication with a peak about 2K. BTW, Barry, I tried out your suggestion about direct input to the O2 with no external EQ, rolling off the low end as you suggested. Did not make that much difference even rolling off all the lows. My buddies told me it sounded like Mickey Mouse with large testicles!!!! Anyhow, I appreciate all the suggestions, and pick up a lot of hints by the users of this group who are way smarter than me! Have a great Sunday evening! 73,

Ralph, NA6D

What I was suggesting was that you remove the external EQ (zero all the controls) and then set the Orion TX EQ for the best bass/treble balance. THEN, fiddle with your external EQ to optimize your tx audio. In other words, don't fiddle with the external EQ until you first set the Orion TX EQ.

The hardware MIC gain only controls the gain of the mike channel and not the LINE channel. Is the Signal Link output level set for Mike level or Line level output? The Orion Line Input requires Line level signals and mike level signals that are typically -40 dB and thus way too low for a Line Level input.

Check your output level configuration of the Signal Link.

I am having this exact problem with my Orion II and a new Signalink USB. I am using the cable provided by Signalink to my Aux I/O Port (8 pin). I have tried setting the TX Audio Source to AUX, increasing the Aux Input Gain all the way to max (100), increasing the H/W Mic Gain to max, increasing front panel MIC gain to max and turning on the SP and setting it to max. There is no ALC indication and no audio out, the transmitter goes into transmit when trying to send. I would hate to think that I will have to use the front panel mic jack to get this working.

The best mike in the world will likely sound bad on ham radio. One is typically looking for a frequency response of about 4 KHz at most. A mike with a bountiful amount of low end will likely sound mushy on the male voice. Also one must consider the proximity effect specially with dynamic mikes. Just because a mike is reported good for one person does not mean it is equally good for another person.

There two things I've learned about mikes, (a) the mike must be correct for the artist and (b) the correct mike technique must be used. By the way (b) is very important. To confirm the point, in our church sound system we use a matched pair of Neuman mikes on the grand piano. Move the mike pair 3" one direction and the piano sounds more like glass breaking, move them back 3" and it sounds like a wonderful Yamaha concert grand. There is a "sweet spot" that works and it is no larger than a tennis ball. That's mike technique in operation.

Personally having spent some 16 years in the studio of a major recording company, frequently I've found it necessary to try 3 to 6 different mikes, brands and models on a specific artist to get the sound we wanted. And add to that, I had at my fingertips some of the most sophisticated and modern signal processing methods and equipment available.

A very successful, old and wise recording engineer once told me "audio is somewhat like crap, the more one stirs it the more it stinks". In summary: If it isn't good at the mike, it won't be good down stream.

What I was suggesting was that you remove the external EQ (zero all the controls) and then set the Orion TX EQ for the best bass/treble balance. THEN, fiddle with your external EQ to optimize your tx audio. In other words, don't fiddle with the external EQ until you first set the Orion TX EQ.

I have a very deep voice. I use the Regal mic and use processing set on 5 and no equalization. I get excellent reports. Have mic gain on 100. People tell me that this is the best that they have heard me.

Did you try running Orion TX EQ at -15 to -20dB to roll off your lows?

Thanks Bob and everyone else with interest about this topic. BTW, my problem is with the Orion II but I left the subject line alone.

Again, the issue is NO MODULATION ON TRANSMIT while driving the radio through AUX I/O using a Signal Link USB adaptor. Receive is fine but it will not transmit digital tones. PTT works fine from the Signalink and the radio is put into transmit. TX Audio Source is set to AUX.
Here's what I did to try to fix this issue but its not resolved:
1. As suggested by PA1AP, I checked to see if there was any voltage between pin 4 and ground on the AUX I/O socket. Found there is no voltage between pin 4 (Line out) and ground or any other pin.
2. Signalink can increase the audio output to the radio by setting a jumper (JP3) in the Signalink. This had no effect. With this jumper installed though I can hear weak tones in a monitoring receiver in the shack where I could not without the jumper set. However, there still is NO ALC indication. AUX Input Gain was varied from 5 to 100 to try to reach a level where ALC would be present.
3. I checked the cable supplied by Signalink from the RJ45 to the pins on the jumper socket in the Signalink. All looked fine.
4. I checked the levels for the playback and recording sounds in Windows. No setting I made from min. to max made any difference.
6. I then substituted the Signalink for a TenTec 712 Adaptor which is known to be good (its truly plug and play on my TT Argo V). As John Henry recommended the 5 pin DIN from the 712 fits fine in the 8 pin AUX I/O port of the Orion II. Using this adaptor produced all of the same results above.

Then, I shifted operation to my Omni VII with the following results:
1. The Ten Tec 712 Adaptor was totally plug and play. I just plugged it into the PC, let the driver install, plugged it into the Omni VII and away it went in both receive and transmit mode. I used this config for most of the CQWW RTTY contest this weekend.
2. Near the end of the CQWW RTTY contest I wanted to see if the Signalink would work with the Omni VII. It did, and again it was totally plug and play. It was so easy I only literally had to plug it in and start using it.

My Conclusions:
1. Both of my adaptors work fine (TT 712 and Signalink USB) as proven by operation with the Omni VII.
2. Both cables for my SL-USB are fine. One checked out by VOM, the other by actual operation with the Omni VII.
3. The jumpers I installed in the SL-USB are fine since they work on the Omni VII. I also checked these with a VOM when trying to get the O-2 working.
4. My main conclusion is that there is something wrong with the AUX I/O port on my Orion II. It probably has been bad since I bought it new about 3 yrs ago because this is the first time I have tried to use the AUX I/O port.

Alternative
The alternative will be to use the front panel MIC jack with either of these sound card adaptors. It will be easier with the Signalink because the SLUSB to radio cable is removable. I will use an existing RJ45 cable I have and install an 8 pin mic plug on the other end for the Orion II and give it a try.

I can't think of anything else to try on the Orion II. If there are any more ideas out there I would appreciate hearing from you. As always, I appreciate all of the input I have received from the great bunch of guys on this list.

The hardware MIC gain only controls the gain of the mike channel and not the LINE channel. Is the Signal Link output level set for Mike level or Line level output? The Orion Line Input requires Line level signals and mike level signals that are typically -40 dB and thus way too low for a Line Level input.

Check your output level configuration of the Signal Link.

I am having this exact problem with my Orion II and a new Signalink USB. I am using the cable provided by Signalink to my Aux I/O Port (8 pin). I have tried setting the TX Audio Source to AUX, increasing the Aux Input Gain all the way to max (100), increasing the H/W Mic Gain to max, increasing front panel MIC gain to max and turning on the SP and setting it to max. There is no ALC indication and no audio out, the transmitter goes into transmit when trying to send. I would hate to think that I will have to use the front panel mic jack to get this working.

Just checking to make sure you had the PTT pin wired up between the SL and the Orion. Mine didn't work without doing that because there wasn't enough signal there to trip the VOX, even with the GAINs all the way up.
The only other thing I tried that you haven't is to connect the audio out from a variable source such as your O7 to the AUX-IN. You may have to turn it up quite a bit, but at least you could get signal to flow through the AUX port. Like I said, I didn't have any success until I reached at least 1.5 v p-p going into the AUX-IN port. It sure felt good when I finally heard a signal coming through on the audio MON on the Orion.

As far as mine goes, it worked like a charm all weekend. I even had to turn the audio level down quite a bit to get to the point where the power output just started to drop and the ALC was off most of the time. There's so much audio there now I don't know how I've been missing it all these months.

> Good news - I think. The Tech from Tigertronics called late yesterday and we went through the setup. I explained that I had the rig working with HRD, DigiPan, and RMS Express with the 712 dongle, but couild not get it to work with the SignaLink. Maybe I am dense, but a few of their steps in the setup are not as clear as they could have been. That said, after about 15 minutes we had it working perfectly. I doubt that I will use HRD very much because it had too many options for my needs. I will do a little PSK31 using DigiPan and use RMS Express for WinMor ARES communications.

Hi Art,
Yes, the PTT wire is part of the cable provided by Signalink. The PTT worked, PTT showed on the SLUSB and the radio went into transmit, just no modulation.
I guess I'm confused by your other suggestion. I am not sure how or even why I would feed audio out of my Omni 7 into the AUX I/O of my Orion II. For one, the problem I am having is not receive. I can receive just fine with the Signalink on the Orion II, I just can't transmit. I did try setting JP3 on the SLUSB but that didn't do anything either. Setting JP3 is suppose to increase the audio output of the Signalink. I believe it does but it didn't have any effect on the problem.

Thanks Art and 73

From: Bob McGraw - K4TAX
Topic: 7077 Message: 7144

The Signal Link and the 712 interface both provides a hard PTT command to the radio. It should not be necessary to use VOX with either of the interfaces. Seems that others have had issues in this area. Jumper settings for the Signal Link must be configured accordingly for this to take place. The 712 is a plug-n-play interface and no jumper or configuration is needed.

The 5 pin DIN connector on the 712 does correctly plug into the AUX 8 PIN connector and is properly configured for signals and levels.

Hi Art,
Yes, the PTT wire is part of the cable provided by Signalink. The PTT worked, PTT showed on the SLUSB and the radio went into transmit, just no modulation.
I guess I'm confused by your other suggestion. I am not sure how or even why I would feed audio out of my Omni 7 into the AUX I/O of my Orion II. For one, the problem I am having is not receive. I can receive just fine with the Signalink on the Orion II, I just can't transmit. I did try setting JP3 on the SLUSB but that didn't do anything either. Setting JP3 is suppose to increase the audio output of the Signalink. I believe it does but it didn't have any effect on the problem.

Thanks Art and 73

From: art davis
Topic: 7077 Message: 7145

No no. I was just offering a suggestion on where you could find an alternate source of audio to feed into your AUX-IN port besides the SL. One that would give you a higher amplitude signal than the marginal output of the SL. In my case I took the audio from the headphone output of a Drake R-4B receiver and fed it into the AUX-IN.

Do you have a scope that you can use to look at the level of audio you're putting into the Orion?

Hi Art,

Yes, the PTT wire is part of the cable provided by Signalink. The PTT

worked, PTT showed on the SLUSB and the radio went into transmit, just no

modulation.

I guess I'm confused by your other suggestion. I am not sure how or even

why I would feed audio out of my Omni 7 into the AUX I/O of my Orion II.

For one, the problem I am having is not receive. I can receive just fine with the Signalink on the Orion II, I just can't transmit. I did try setting JP3 on the SLUSB but that didn't do anything either. Setting JP3 is suppose to increase the audio output of the Signalink. I believe it does but it didn't have any effect on the problem.

Thanks Art and 73

A new Word file is now in the files section showing all of the settings on both the laptop and the SignaLink.

--- In orion565@yahoogroups.com, "Skip" <ebhudgens@...> wrote:
>
> Good news - I think. The Tech from Tigertronics called late yesterday and we went through the setup. I explained that I had the rig working with HRD, DigiPan, and RMS Express with the 712 dongle, but couild not get it to work with the SignaLink. Maybe I am dense, but a few of their steps in the setup are not as clear as they could have been. That said, after about 15 minutes we had it working perfectly. I doubt that I will use HRD very much because it had too many options for my needs. I will do a little PSK31 using DigiPan and use RMS Express for WinMor ARES communications.
>
> Now to go make screen shots of all of the places we made setting changes so when it screws up or I have to reconnect it to the XP maching I will have a record of what we did. Or I can just go back to the 712 which is true plug and play.....

> > >
> > > Finally, I have 2 alternatives I can use to check this a bit more. I have an Omni 7 so can check the Signalink on there (uses a different cable to a 5 pin din). I also have a TenTec 712 interface which I may be able to check with the Orion II but TT's instructions are confusing. The DIN plug on the TT712 Adaptor is 5 pin and they say to use it with the Orion II plug it into the AUX IO port (which is 8 pin DIN). I've never used a 5 pin DIN connector into a 8 pin DIN jack - would it even fit?

I have the rig working with both DigiPan and RMS Express to run PSK31 and WinMor using the Ten Tec #721 USB sound card, but can not get it to work with the SignaLink. In HRD sound card setup it shows the card with wave on the send, but is blank on recieve where

it should show line in.

But I'm starting to wonder if there isn't something we're missing here. I opened my Orion back up this weekend and did some more signal tracing. I was able to confirm signal all the way to the point where there were other functions that shouldn't be working but that are, except for AUX-IN. I look at the audio going in on my o-scope and it looks normal, about 1 V p-p, with the gain at 100 and - nothing!

Yes sir, all that you reported below is absolutely correct. If you set the jumpers according to Signalink instructions it triggers transmit on the radio just fine and there is no need to use VOX.

The TenTec 712 is terrific. Genuine plug and play. Just establish the settings in the instructions for your Ten Tec model and away you go. And what's great is that the Argo V is setup for digital and there is absolutely nothing to change in the radio. And as you stated there are no adjustments you can make to the TT 712. So on the Argo V you really plug and play. I was so pleased with that.

And, much to my amazement, the 5 pin DIN fits perfectly into an 8 pin DIN socket. I had never thought about that before so Ten Tec was sure thinking. That works great. And many thanks to John Henry of Ten Tec for pointing that out to me.

Thanks again Bob for all your help, not only with my little digital problem, but for all that you do here on the reflector. I can see you're a big help to many people.

The Signal Link and the 712 interface both provides a hard PTT command to the radio. It should not be necessary to use VOX with either of the interfaces. Seems that others have had issues in this area. Jumper settings for the Signal Link must be configured accordingly for this to take place. The 712 is a plug-n-play interface and no jumper or configuration is needed.

The 5 pin DIN connector on the 712 does correctly plug into the AUX 8 PIN connector and is properly configured for signals and levels.

Hi Art,
Yes, the PTT wire is part of the cable provided by Signalink. The PTT worked, PTT showed on the SLUSB and the radio went into transmit, just no modulation.
I guess I'm confused by your other suggestion. I am not sure how or even why I would feed audio out of my Omni 7 into the AUX I/O of my Orion II. For one, the problem I am having is not receive. I can receive just fine with the Signalink on the Orion II, I just can't transmit. I did try setting JP3 on the SLUSB but that didn't do anything either. Setting JP3 is suppose to increase the audio output of the Signalink. I believe it does but it didn't have any effect on the problem.

Thanks Art and 73

7149. Connect Palstar AT-Auto and Computer to Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2011-09-29 02:24:54 UTC
From: ko0q_gary
Topic: 7149 Message: 7149

I'm trying to figure out how I can run both my Palstar AT-Auto tuner and my DX4WIN computer logging software into the Orion II. The Palstar connects directly to the RS2332 port on the Orion II to get frequency data.

The DX4WIN computer program will like most other logging programs control the Orion II using the same RS232 port.

I tried a "Y" cable as specified by Palstar but it didn't work - it just gets transmit data from the Orion and ground. It isn't able to send queries or other requests for info since you can't connect the receive in the "Y" cable as it would interfere with DX4WIN.

The only option that I can find that could possibly work to share the data is a MicroHam Microkeyer II, but at $500 I'll pass on it for now. I could put the Palstar into "Vintage" mode, but then it wouldn't follow the frequency and I'd have to tune it up each time I made a change.

Any ideas?

Gary KOØQ

A virtual com port might do the trick, like VSP Manager. Also, the Yahoo Palstar AT-Auto group may be the place to find the answer.

Good luck,

7152. AT tuner loses setting

Yahoo group: orion565 (2009 — 2013)

From: storygene
Topic: 7152 Message: 7152

I can AT auto-tune a frequency fine. If I switch bands and then come right back to the band I was on, the tuned setting is lost. Is this something I am doing wrong? Perhaps an internal battery backup is not working?

Gene / K7TXO

Gene,

The radio is operating as designed. There are no memories in the standard AT version tuners.

73,

John

Ahh! Ok, thank you John. I can easily work with that.

New to Orion 565 ownership. Everything else works as expected except for the quality of reception. It is way, WAY better than my expectations. In a word:

WOW

CW keying is marvelous. I'll have to make voice contact with someone to get a good on the air report and likely will need to tweak the settings a bit. SSB testing I have done so far into my dummy load while listening on another receiver, the range of audio control is magnificent.

Anyway, thanks for the answer John. This is truly an amazing radio. My only regret is having taken so long to get my hands on one.

7155. question about amp and radio compatability

Yahoo group: orion565 (2009 — 2013)
Date: 2011-09-30 15:47:51 UTC
From: aztarheel
Topic: 7155 Message: 7155

I just purchased a Orion II and I have a Ameritron AL80B amp. Are the two compatible? do I need a external relay box between radio and amp?
will the Heil mike with HC-5 work best (I use a BM 10 headset)or should I invest in a TT mike?
any suggestions appreciated. thanks from a newbie to TT radios.

Ruby KF4NI/7

Topic: 7155 Message: 7156

Ruby,

I can't provide any response with respect to your amp question as I don't have the same amp (mine is a ALS-600). But you should have no problem using the Heil mike with HC-5 element. As to which is the best to use, no need to invest in Ten-Tec mike even though their mike is made by Heil also. I use a Heil Proset Elite with HC-6 element. It works very well after I made some audio adjustments on my Orion II. I have received several unsolicited audio reports indicating how natural I sound while using SSP phone.

Good luck with your Orion II, you're going to love it (;-)

Ruby, I can't give you any advice on interfacing the Orion II to the AL-80B but I would think it would be pretty straightforward. Maybe give Ten Tec a call and talk to one of the techs.

I did want to say though, what a great combo! I have an AL-80B and it's a great amp. I think you're going to like it. Hope to have an Orion II in the near future in my shack. Enjoy...

Hi Ruby. Page 38 of my Orion II Operator's Manual says that the external AMP KEY lines should not have more than +100V applied nor should the current to be switched be more than 250 ma. They go on to say that older Collins, Drake, Heathkit have more than 100V on the key line. Just about any amp made in the past 30 years or so will have a small voltage on the key line (12V or so?) and the current draw will be below the 250ma limit. For example, the AL-80B key line is at 12VDC and when keyed the current that flows is only 100ma. The Orion II handles that easily.

There's absolutely NOTHING to be gained by using an external "relay box" in this case. For any amp you'd ever want to use, you can easily check to see if the voltage and current are within the O2 limits. Using a voltmeter, measure the voltage on the amp's key line to ground. Then using a milliameter, short the key line to ground and observe the current reading. If both readings are within the limits, you're good to go.

From reading dozens of forums over the past few years, I'd say that this is probably the most asked question in all of amateur radio! While there are probably many current transceivers that might have trouble switching up to 100V on the amplifier key line, the O2 was done "right" in this respect.

I am using an Orion 2 with an AL 80 BQ (QSK.) I am running it directly with no relay box. The only thing I had to do was delay the T/R on the rig to 1% because of the QSK module within the amp. The O2 works like a charm with the amp.

7160. Re: RX366; new sub receiver*

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-01 22:58:44 UTC
From: radiomike_58
Topic: 7150 Message: 7160

This looks to be a very positive development. I was thinking that the next major rig would be 2 Eagles in the same box. I am curious as to how the new version 3 software differs? Hopefully they retain the operability of the current sub receiver, at least 595 filters(filters for every 10 Hz), with the much better synthesizer/filtering of the Eagle. I would be interested in seeing more concrete spec's on this receiver board, as I think that it would be a good addition to my Orion I.

As for the next level, An Orion III would be interesting if it was a Direct sampling SDR,(similar to Perseus/QS1R) with the stiff front end/filtering of the RX-340 ahead of it, to improve on blocking performance. In fact using the rack mount design of the 340 would set it apart from the consumer grade construction of other Top Ham rigs with the exception of the Hilberling. Other features that would be innovative would be the addition of a HDMI port for the audio/video out, VGA video port for a monitor, keyboard and mouse out and a built in computer.(everything in one box). Conventional knob/button interface for those who want it, but the ability to operate with software such as HDSDR or a proprietary version for the rig, using the keyboard/mouse. The best of both worlds. Just some thoughts.

Awaiting further info on the 366.

73,

Mike KA0KLQ

7161. LCD display dims or blank when xmit CW high power

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-07 06:45:36 UTC
From: storygene
Topic: 7161 Message: 7161

What would cause the LCD display to flicker/dim when transmitting CW at above 25 watts? The issue gets progressively worse as I increase RF transmit power to the point where at 100 watts, the display blanks completely in step with CW tranmission.

On SSB, no issue or at least not that my eyes can discern?

Power supply and rig are well grounded. SWR match excellent. Different antennas and dummy load make no difference. ASTRON SS-30M connected direct or through my power pole distribution; same difference.

CW on my KENWOOD TS-2000 using same power supply and power pole distribution and same antennas and dummy load works fine at full 100 watts.

Although the power connector pins at the back of the rig look ok and the connector body seems to latch on ok, could this perhaps be a high resistance connection of the molex pins showing up under more of a load in CW mode?

Gene / K7TXO

Also check high resistance on the fuse holder.

If you have a powersupply with variable voltage could you turn down the voltage while receiving and share at which voltage the LCD switches off?

I will need to check at my unit but from memory I can turn down to 12 Volt without the LCD to blank out. Please share the threshold voltage at your rig.

On my unit I found that both fuse and power socke were causing voltage drop leading to issues. After the fuse fix (clean it) as well power pole replacement issue was gone. But your rig might have other issues...

Another problem could be the dc-dc regulator and you would need to measure if all voltages are still as designed.

On SSB -> If you wissle into the mic does the ALC indicator light up? Are you sure 100W comes out of the unit? And under those conditions the LCD screen does not dim?

Anyway, just some thoughts. I hope you can solve the issue soon! Best regards, Onno de pa1ap

I just measured the following;

With LCD contrast set to optimum value and DC voltage to 13.8 Volt, I changed the voltage to observe the LCD thresholds;

1- On receive only; threshold for the LCD to turn white is 11 Volt.

2- On receive only; threshold for the LCD to start fading is 12 Volt

3- On transmit 100W CW; threshold for the LCD start fading is 12,5 Volt. You will notice the backlight blinking at pace of CW

I have measured the voltage at the power supply and realize the best place would be the orion powerplug. Original cable but I replaced the powersupply socket at Orion with powerpoles.

No difference found between Voice or CW with regards to LCD dimming or going blank.

Hope this helps, Regards, Onno de pa1ap

Does anyone know for sure the exact replacement part number for the Orion backup battery. Perhaps it's the STM Snaphat M4Z28-BR00SH1 or M4Z32-BR00SH1 but does anyone know precisely?

Thanks & 73,
Barry N1EU

I'm not going to take my Orion apart to read any #'s off of it however their invoice only shows:

1-ORION BATTERY (37009)

My 10 year battery lasted 18 months. Something wrong here. And to boot, they CHARGED ME $9 plus shipping for it ?!!

Sam,

My Orion is 8 years old and I am still on the original battery. I don’t know if this makes any difference, but my power supply is always on even though my rig is off. I did not look to see if the 12 volt supply is holding the memory. Reading the PDF diagrams can be challenging!

73,

John

I replaced mine a couple of years ago using:

http://parts.digikey.com/1/parts/605224-ic-snaphat-batt-crystal-28-soic-m4t32-br12sh1.html

The battery comes in 2 flavours and both the M4T28 and M4T32 are available from Digi-Key.. The M4T28 is 48mAh (the stock battery) and M4T32 a 120 mAh. I chose the latter and it fits.

The part number on the original was:

M4.T28-BR12SH1 (I don't know why the dot is there either)

If I were doing it again I'd consider using a CR-2032 and holder. The Snaphat has a battery and built-in clock. However, the clock is not used in the Orion.

Barry,

Here is a hint that you may find useful when you tear into the rig to replace the battery: I found referring to the sweep display upgrade procedure useful in that it gives step by step instructions on how to get inside the front panel. (That's where the battery is.) Be careful when you disconnect the cables and get them all back in the right place. Also, you'll need a small Torx bit for some of the screws.

Can't help you with the battery part number. I just called TenTec and got out my plastic.

There's a good summary of the discussion on the intermittent RIT issue here:

http://www.tentecwiki.org/doku.php?id=565ritfix

Is silver conductive grease ($$$) the only long term fix? Is there
another more cost effective fix that holds up over time?

Thanks & 73,
Barry N1EU

Though not answering Barry's question, my 565 went back to the mothership about two years ago for treatment of the problem the factory had still never seen. I had had a many-year continuing wrestling match with them over the issue. They performed the latest solution (I forget the details of what they did) and the 565 has not missed a RIT beat since. Sending the 565 back was a hassle, and the fix was not cheap--but it was worth it to me.

The combination of the factory Orion power cable which might be 12 ga wire, power pole connectors into an external crowbar circuit, another pair of power pole connectors and another three feet of 12 ga wire provided enough IR drop to cause this issue. I took the radio directly to the power supply with the factory Orion power cable and the issue is entirely gone.

Individually, each stage of the connection was reasonable. Collectively it added up to be marginal. I think in part the factory cable is ahh, limiting. And the Orion is definitely sensitive to slightly lower voltage compared to other rigs. But the other components in the chain each contributed to the issue.

I will purchase 10 ga wire and re-work the configuration. I will have to switch to 45 amp power pole connectors if I want to continue using this type. I like the universal nature of these connectors. I positively do not like their sloppy mating. However, ANDERSON has come out with sonic welded pairs of the 45 amp connectors and retention clips to keep a connection-pair mated together so there is a solution available.

Fun to resolve issues like this actually. And I am very glad that the rig itself is fine. What a joy to operate an Orion. The rest of my non TEN-TEC rigs do not get used much since the Orion was brought into the shack.

I've experienced several instances where the utilization of the crimp connection method was not adequate. Therefore, I always use the "crimp and then solder" method for all power connections.

I'm a firm believer in using a separate dedicated ground between the radio and the power supply as the DC power negative is not solely adequate. Any IR drop in the negative lead placed the radio above ground by several millivolts. The power supply negative or power supply ground terminal is then common point for station ground if one is used.

I've found that #10 ga automotive primary wire works well and is suitably flexible for most all power applications and ground applications.

Totally agree with you on that Bob. I solder all of my crimp connections here in the shack and most everywhere else if a hot iron can be had.

Since the addition of the Orion required me to scoot the power supply to a different location, I admit at the moment, the proper PS chassis direct to ground point wire is not in place; it will not reach. A roll of braid arrived yesterday so the PS comes out of its hole tonight and that important path gets put back in place. It's alligator-clipped to station ground right now but that is hardly any sort of effective path to ground that way.

I'm relieved to see that someone else has experienced the sloppy mating of PowerPole connectors. I bought my first ones at a hamfest this summer and was sorely disapointed when I mated the first pair, thought they must be defective. But I went ahead and used them anyway to provide a quick disconnect for the orion from it's power supply. I found that I have to keep them tied together or they keep de-mating. Electrically they're OK, not great as I had hoped. Live and learn...

Subject: Re: [orion565] Re: LCD display dims or blank when xmit CW high power

I've experienced several instances where the utilization of the crimp connection method was not adequate. Therefore, I always use the "crimp and then solder" method for all power connections.

I'm a firm believer in using a separate dedicated ground between the radio and the power supply as the DC power negative is not solely adequate. Any IR drop in the negative lead placed the radio above ground by several millivolts. The power supply negative or power supply ground terminal is then common point for station ground if one is used.

I've found that #10 ga automotive primary wire works well and is suitably flexible for most all power applications and ground applications.

Onno -

The combination of the factory Orion power cable which might be 12 ga wire, power pole connectors into an external crowbar circuit, another pair of power pole connectors and another three feet of 12 ga wire provided enough IR drop to cause this issue. I took the radio directly to the power supply with the factory Orion power cable and the issue is entirely gone.

Individually, each stage of the connection was reasonable. Collectively it added up to be marginal. I think in part the factory cable is ahh, limiting. And the Orion is definitely sensitive to slightly lower voltage compared to other rigs. But the other components in the chain each contributed to the issue.

I will purchase 10 ga wire and re-work the configuration. I will have to switch to 45 amp power pole connectors if I want to continue using this type. I like the universal nature of these connectors. I positively do not like their sloppy mating. However, ANDERSON has come out with sonic welded pairs of the 45 amp connectors and retention clips to keep a connection-pair mated together so there is a solution available.

Fun to resolve issues like this actually. And I am very glad that the rig itself is fine. What a joy to operate an Orion. The rest of my non TEN-TEC rigs do not get used much since the Orion was brought into the shack.

Good news and happy to hear it was an outside factor causing the challenge. As others recommended I would still take the fuse out to check if it is dirty. If so clean and reinsert a couple of times. That would make it all "perfect". best regards, ONno

Well my experience is very postive using powerpole connectors. I did find the first mounting was poor and I had to redo it. If the internal "spoon" is inserted wrong or not far enough the connection is indeed wobbly at best. I have "upgraded" all my connections to powerpole, even in mobile station, and so far so good.... I might have been lucky... By the way, I dont crimp and just solder the wire into the small bus. Be careful to keep the remaining part of the "spoon" clean and in same shape.

I also solder instead of crimp. I thought that maybe the "spoons" lost their temper and "spring-i-ness" by heating them up, but looks like you have proven that was probably not the case.

Other than the 3rd pin AC mains safety ground, I do not have an external ground on the station equipment. I do tie each piece of equipment, using a dedicated conductor, back to the common point on the station power supply. If one uses an external ground, this would then be the common point for connection of that ground.

Also I'm aware that PowerPole now has pairs of mating connectors that are not separate pieces and thus held together only by a roll pin. In my case when assembling the PowerPole connectors, I use the roll pin but also use a drop or two of the famous "super glue" to keep the black and red pieces together.

Totally agree with you on that Bob. I solder all of my crimp connections here in the shack and most everywhere else if a hot iron can be had.

Since the addition of the Orion required me to scoot the power supply to a different location, I admit at the moment, the proper PS chassis direct to ground point wire is not in place; it will not reach. A roll of braid arrived yesterday so the PS comes out of its hole tonight and that important path gets put back in place. It's alligator-clipped to station ground right now but that is hardly any sort of effective path to ground that way.

7182. RE: [orion565] Re: LCD display dims or blank when xmit CW high power

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-13 19:30:44 UTC
From: art davis
Topic: 7161 Message: 7182

Just for the record, I opened up my Orion and took some measurements.

On receive, voltage at the input power connector (power poles) = 14.002V. (power supply output = 14.15V)

Key-down, CW, 100W out, SWR 1.0:1 (this is important), the V dropped to 13.23V. (P/S out=14.08)

At SWR 2:1, V=13.02 with some dimming.

Inside the radio, I measured a maximum drop of 45mV (.045V) between the input power pole and the input to the PA during key-down.

For power cable, I use 6 feet of #12 red/white zip cord (true #12) connected to radio with power poles.

Subject: [orion565] Re: LCD display dims or blank when xmit CW high power

Well my experience is very postive using powerpole connectors. I did find the first mounting was poor and I had to redo it. If the internal "spoon" is inserted wrong or not far enough the connection is indeed wobbly at best. I have "upgraded" all my connections to powerpole, even in mobile station, and so far so good.... I might have been lucky... By the way, I dont crimp and just solder the wire into the small bus. Be careful to keep the remaining part of the "spoon" clean and in same shape.

>

>

> I'm relieved to see that someone else has experienced the sloppy mating of PowerPole connectors. I bought my first ones at a hamfest this summer and was sorely disapointed when I mated the first pair, thought they must be defective. But I went ahead and used them anyway to provide a quick disconnect for the orion from it's power supply. I found that I have to keep them tied together or they keep de-mating. Electrically they're OK, not great as I had hoped. Live and learn...

not accepting any compromise I am installing new cables. Have to figure out how to connect it to the powerpoles but its a good start. Wife made a picture while installing the new wiring :-)

7184. Re: 253

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-13 21:51:09 UTC
From: Edward Feustel
Topic: 7184 Message: 7184

I have a 311, the connecting cable, and a 253 that are surplus to my needs. If you
are interested. (I used balanced antennas).

If you want to use the 253 on 60 meters, you will need a non-TenTec cable as it omits the wire that controls the tuner on 60. My cable has the additional wire.

I used mine first with the Paragon II and bought a 311 from Ten Tec after I traded
the Paragon for an Orion 565.

I am curious as to if the filter steps(10Hz between bandwidths) will be the same as the existing Orion Sub Receiver?? This should be a major step forward, with the ability to use the roofing filters, the quieter synthesizer, 9MHz 1st IF and all. Has anyone heard any additional details such as projected cost?? As an Orion I owner, I am interested.

No, the 565 and 566 will not do general coverage transmit.

Traded my Flex 5000A for O2 with all the options. I love my O2! Forgot what it was like to have a "big knob" radio again! I'd like to use an external pan display that tracks VFO A. Not looking to control the O2 via my computer......just wanting a panadapter. Any ideas/suggestions would be much appreciated.

Thanks for reading.

I recommend installing the tap for the 9 MHz IF in the O2 per the VE7TK documentation and then using an SDR-IQ and SpectraVue as the panadaptor. SpectraVue fully supports the Orion II and with the resulting panadaptor display you can even mouse on a signal you see on the panadaptor and the Orion will be immediately tuned to that signal. This approach uses the smallest number of hardware/software pieces/parts and it won't require constant attention to keep it running properly. If you use a logging program, you can still access the Orion II port by using a port sharing program (I use VSPE, which is free for 32 bit Windows systems).

LP-Pan is another approach, but keeping the related free software running on my Win 7 system was more trouble than I needed. I'd also avoid the approach of NOT using the IF tap and just sharing the antenna between the SDR-IQ and the Orion. The SDR-IQ sensitivity is less than required on 12 and 10 meters and there are other undesirable issues to deal with. Using the IF/SDR-IQ method, any signal that you can hear on the Orion (even the very weakest CW signal) will produce a visible indication on the panadaptor. Others disagree with these opinions and prefer to not use the IF approach. All I can say to that is they are obviously less critical of the final result than I am!

Nice job on the pixs, the write-up and the replacement of the caps. Also the choice of the 105 degree caps is a real plus over the standard 85 degree caps.

7199. FTDX5000D First Impressions vs Orion 2

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-19 19:12:52 UTC
From: dxsteve2000
Topic: 7199 Message: 7199

FTDX5000D first impressions vs Orion 2 which I have owned for 4 years

1. The FTDX5000 has really nice knobs starting with the main tuning knob. It brought back memories of some of the main tuning knobs of the 60s. Having separate knobs for rf gain, power, if shift, noise reduction is great. I was glad that the rf power knob is not one of the smallest ones like the FT1000 MP. One knob does all belongs on a mobile or portable rigs not a $4000 transceiver. The Orion knobs are not the quality they need to be for a rig of that price range. I have heard others say the FTDX5000 has a luxury feel to it. I think they are right.
2. Noise reduction that really gets rid of white noise. It was almost a religious moment the first time I tried the noise reduction. The orion noise reduction is poor by comparison.
3. The noise blanker comes with narrow and wide modes and is also effective. The Orion hardware noise blanker worked well but the software one was largely ineffective.
4.The bandscope on the external SM5000 is fair. It is good for high signal levels and tends to show cw signals wider than they are. The Orion bandscope is very poor. Ten Tec promised a high speed sweep board 4 years ago and still have not delivered.
5. It has 6 meters. I used my FT 857D for 6 meters before I bought this rig. Six meters belongs on future Orions.
6. 200 watts even on 6 meters. This gives my AL1200 enough drive to easily put out full legal limit. It requires about 130 watts with the 3CX1200Z7. The 100 watts on the Orion got me about 1250 watts on most bands.
7. The real meter on the new rig doesn't pin at full power. What was Ten Tec thinking? I also like the other meter modes.
8. 9 MHz IF output is built in. I added an amplifier to the Orion to get the output. This is good for LP Pan and skimmer.
9.The cw variable audio peak filter is also valuable in conditions near the noise level. The Orion does not have this function.
10. The menu adjustments on the Orion are easier to navigate. I was surprised to see that the Yaesu AGC could be programmed similar to the Orion.
11.The dynamic range and IP3 of both rigs are excellent. Although the FTDX5000 is rated higher than the Orion both offer performance only seen in down conversion rigs.
12. Both rigs offer no ringing super narrow cw width adjustment. 50Hz on the FTDX 5000 and 100 Hz on the Orion. Both seem overstated by 50 Hz. Both rigs offer optional 300Hz roofing filters. Buy them. The Yaesu uses a 6 pole filter. The Orion 2 uses 4 poles.
13. The remote keypad that is included with the rig can run the voice keyer on the Yaesu that has more memory flexibility than the Orion. I used an external voice keyer before.

Is the FTDX5000 worth the extra money. Absolutely! I expect this radio will get market interest that rivals what the FT1000MP had. I hope that the folks at Ten Tec and Elecraft can regain their previously held number 1 positions. It is going to take more work on other features than dynamic range and IP3 to get my number 1 vote. Ten Tec is working on a dual down converting Orion that is suppose to come to market soon. This could give you some serious diversity reception capability. Without addressing most of the other issues mentioned above they can't move back into the number 1 position.

Topic: 7199 Message: 7200

Since this IS the Orion reflector, allow me to throw my own biased 2 cents into the ring. I looked long and hard at the FT5000. It certainly seems to be a very fine radio. However, the reasons it won't supplant the Orion for me:

- FT-5000 without the outboard display option lacks simple numeric display of all the operating parameters simultaneously
- FT-5000's vastly inferior subreceiver with no ability to upgrade it (like the new Ten-Tec RX366)
- incredibly expensive, especially if you go for the u-Tuning units
- excessive amount of seemingly useless bells and whistles on the FT-5000 was off-putting

In full disclosure, I could care less about spectrum display, dsp NR, and 6M. Bandpass filtering is all the noise reduction I ever want a radio to do.

The FT-5000 really looks like a clone of the Orion architecturally, with a fancy Yaesu interface around it. I've got more respect for what Elecraft did to follow the Orion than what Yaesu did. And I got a whole lot more respect for Ten-Tec's achievement introducing the Orion in 2002.

In my eyes, the FT-5000 hasn't supplanted anybody's lead position in the market. I've long monitored the Ten-Tec and Elecraft reflectors and there's hardly even been mention of the FT-5000, ever. I consider the Orion/RX366 and K3 (dual rx) both superior to the FT-5000.

I'm sure it's a great radio, but I don't think this reflector is the place for its coronation.

My 2 cents.

I bought the FT-5000 and found it to be a very nice rig although it was too complicated for my liking.

I also own a Orion-2, 566, and a Icom IC-7600 and like both of them as well.

The 200 watts out of the 5000 isn't what this station needs to drive my Ameritron AL-82 or my Ameritron ALS-1300 amps. One hundred watts is fine.

I would agree about the band scope on the original Orion 565. Not up to what I want in a bandscope rig but the 566 is adequate.

The 5000 did outperform the IC-7600 in contest conditions but I don't do contesting so it wasn't a consideration.

As for the 5000 band scope there is no comparison to the Icom 7600 and also no comparson to the Orion-2. I wouldn't suggest buying the FT-5000 for the band scope.

That was a poor option for Yaesu to add to the high grade 5000. They could have done better.

Now if you want the Yaesu DMU unit to go with the 5000 which I had a chance to see and use it is what I would expect in a band scope. Nice unit.

I sold the FT-5000 after trying it out because I guess it was just too much rig for my liking but it is a top notch rig.

The Orion-2 and Icom IC-7600 does this station very nicely.

From: floydsense
Topic: 7199 Message: 7203

I've owned the FTDX-5000 as well as the Orion II. In fact, I sold the 5000 to buy the Oroion II. At the risk of insulting 5000 owners, I'll say that the FTDX-5000 has, beyond a doubt, the WORST CW transmitter I've ever seen, and my experience goes back a half century. If you're a 5000 owner, PLEASE NEVER USE IT ON CW. Have a little bit of consideration for your fellow amateurs. No need to go into all the details and brief history here, but if you doubt my statement, please look at your CW waveforms in non-QSK mode (look for characteristics that cause clicks - you'll see them). In QSK mode, look at the relationship of dit length to spaces and dahs. In comparison, the Orion is PERFECT in all respects of the CW waveforms.

While the Orion II spectrum scope is indeed rather poor, when paired with an SDR-IQ running off the IF tap and SpectraVue, the resulting spectrum scope is simply the best there is. The SM-5000 scope for the FTDX-5000 is TERRIBLE, lacking in brightness and in every aspect.

If you never operate CW, then you may be well served by the FTDX-5000. But, there's still no way it's better than an Orion II.

And, yes, the ARRL review said that 5000s after the first or second run had the CW problems corrected, but that simply isn't the case. If you insist on buying one, make sure the store will take it back for a full refund after you check the CW waveforms.

I'd appreciate feedback from Orion users who do a fair amount of ssb contesting. I'm finding it impossible to get a combination of mic gain and SP that sounds like I want. Am I the only one? Does anyone have a secret formula to get it set "right"?

Mic gain 100%. Processing at 7. Using fancy ten tech mike. Get studio quality reports. No equalization.

I run my MIC at 27-30, SP at 7 and use Heil Pro Set 2. I use the DX element 100% of the time and for the last 3 months run 100 watts. I've been able to bust a few pileups with 100 watts and with my new STEPPIR but each time I have gotten EXCELLENT audio reports.

Good luck

John

Barry,

I use a speech processor setting of 7, hardware mike gain (menus) of +5 dB, mic setting of 80-90, and TX equalizer of -15 dB for contesting. The mike is a Ten-Tec 777 headset. I sometimes set the equalizer to -20 dB to break a pileup.

I do not have an amplifier and have been quite successful at DX without one. Great radio!

Hi Barry,

You can check the article on my website which explains the necessary adjustments for full 100 watt output and proper speech processing with the O2.

I believe the article is also in our groups file.

73 and Happy DXing,

Thanks Mike, but your method depends on having an accurate PEP and average watt meter. I can manage the peak meter but not the average meter.

Appreciate all the responses.

Thanks for all the responses. I did some experimenting and came up with something surprising.

When I use the headset into the mic jack, SP works fine like you all reported.

When I turn on SP when using line in ("AUX") audio from an external mic preamp, it's a different story. SP is very difficult to get to work well.

The issue of the external mike preamp is one where it is supplying a very different level than the headset connected to the front panel mike jack. Otherwise, when one changes levels from other sources and adjustments will be required. Seems all is normal to me. If you expect to bounce back and forth between two mikes or mike sources or mike input and Aux input then do expect to make significant changes to the Speech Processing value.

Adjusting the Speech Processor and Mike gain is a basic straight forward procedure. Do understand that your adjustment of hardware MIC gain value and DSP mike gain value will largely depend on the type mike you use and your mike technique, your voice volume and your proximity to the mike.

Here's how:
(a) Set the radio with the power control at the level you wish to operate, normally 100 watts.
(b) Be sure the Speech Processor is off at this point.
(c) Using your favorite mike and your normally warm, charming, voice, and speaking normally into the mike, adjust the MIC gain to produce the required but not excessive ALC action. The mike gain is now correct.
(d) Do not change the mike gain for the next step.
(e) Engage the Speech Processor and again speaking normally into the mike, adjust the Speech Processor value while observing the output meter on the radio.
You should see a 3 to 6 dB increase in power output. You should also see a bit more ALC action.
(f) That's it folks.

The speech processor raises the AVERAGE power by some 3 to 6 dB with normal processing. If you are seeing more than 3 to 6 dB increase then you may get comments relating to "over processed" audio or maybe audio lacking in dynamic range.

I know you've heard it, in listing to stations that are using excessive processing you are likely to hear ones breath as they inhale, their throat noises, gurgles, whistles through the dentures and nasal noises, along with the TV in the background, kids and XYL talking and such. None of which, in my opinion, will get a "great audio" report from me. Any of those noises will not contribute to "great audio".

On a normal analog power meter, a 100 watt radio operated with correct ALC level and without speech processing will typically deflect the meter to a value of 15 to 25 watts. Add Speech processing and the value should increase to about 35 to 60 watts. Keep in mind that the ballistics of the analog meter are slow and are not capable of showing actual peak power values. A true PEP meter has associated electronics that accelerate the upswing and hold the upper value to allow display of PEP values.

Just a follow up to SP with AUX audio source. When I filtered out all the bass <250hz for the AUX audio, SP worked well. So that is where the incompatibility was all along.

Thanks again for all the help. Ready to rock 'n roll for this weekend's contest with SP7, 2100hz TX BW, 300hz LF roll off. I'm using Heil headset feeding mic audio and N1MM soundcard voice keyer feeding AUX audio through Behringer MX802 mixer (Orion TX Audio Source at "BOTH"). It's all sounding great as I listen in a second rx.

7221. Orion 566 packet spot CW & SSB correct filter?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-27 12:05:55 UTC
From: George
Topic: 7221 Message: 7221

I have my Orion II connected to my computer and it is working fine except when I click on a CW packet spot the O2 goes to CW and 2200hz filter. Also if I click on a SSB spot the O2 will go to SSB with a filter width of 500Hz? Hard to make out the words, hi. These are only a few examples. Basically, it’s a crap shoot what I get when I click on a spot for filter width.

Is there a way to convince the O2 when clicking on a SSB spot to go to 2200Hz or CW 500Hz?

I use the packet cluster for DX and this is annoying.

Thanks.

7223. Speech processor - 10M anomaly

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-27 21:21:15 UTC
From: N1EU
Topic: 7217 Message: 7223

I've generally been successful getting the speech processor adjusted following my previous postings and the informative responses.

However, I discovered a problem on 10M SSB with SP. Once again, I'd appreciate hearing whether anyone else is seeing this. ONLY on 10M, I can't get close to max power output when I engage SP - even with audio/mic gain to the max. If I turn off SP, I get max output on 10M. If I change to any lower band, I get max output with SP.

Anybody else notice a significant fall off in power output only on 10M when SP is engaged?

Thanks & 73,
Barry N1EU

George,
I have been running the Orion II remote for years and no problem. One thing you failed to mention is what software are you using to control the Orion II? The best product that I am aware of is the N4PY software. You can find it at n4py.com

Sounds like RFI otherwise, RF getting into the audio, appearing as
"signal" which is controlled by the SP.

Does it do it on a dummy load? If not then sure bet it's RFI.

This was done entirely into a dummy load on all bands. Not RFI.

Process of elimination would then ask, will the radio reach rated output with the SP off? It should with normal mike gain adjustment. Activating the SP should only increase average level and therefore not have any effect on peak level.

Now if the radio does not reach rated output with the SP off, otherwise with normal mike gain, then one might suspect an issue with mixer injection relating to the 10M band. Also, transmit EQ can have effects in this area as well. I suggest setting transmit EQ to 0 or otherwise not use TX EQ for determining what is taking place.

We have to presume that the radio does deliver 100 watts or so on 10M in the CW mode. If not, then there's other areas that should be explored.

I just spoke with Paul at the factory. It is normal behavior for Orions to show a fall off in power output on 10M ssb. Mic gain and SP value have to be increased on 10M. I just don't remember ever seeing mention of this before.

I found that I had to increase mic gain from 10 to 34 when changing bands 20M to 10M (SP off). And when SP is engaged, I used SP5 on 20M and now had to use SP8 on 10M to see good ALC action. Unfortunately, the resulting 10M tx audio sounded distorted with these settings when monitored in a second rx (20M audio sounded good).

With SP at 8 frankly I would expect to hear very compressed audio, likely bordering on distortion.

Again I go to the point of power on CW, does the radio make 100 watts on 10M? And it should reach that value on SSB with the SP off. Agreed, mike gain will likely need to be increased.

I urge setting the mike gain with the SP off such that one gets the correct ALC action. Then engage and adjust the SP to get an increase in average level. You should observe a bit more ALC action under this condition.

If the radio doesn't produce 100 watts on 10M CW then it won't produce 100 watts on SSB.

The cw power output behavior on 10M is the same (good) as other bands.

As I said in my last message, "It is normal behavior for Orions to show a fall off in power output on 10M ssb. Mic gain and SP value have to be increased on 10M." That's what the factory told me.

I don’t think it’s all that uncommon for a lot of radios to balk a bit at higher frequencies like this. Usually, though, it just means bumping up the drive a bit. Not sure I’ve heard of having to add speech processing to attain rated power though. Maybe that’s more common than I realize—I’m a CW guy anyway. Hi. Still, if you only get 90 watts or so at that freq., who’s going to know—except you and your meter!

7234. SignaLink USB for sale $50

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-28 20:40:04 UTC
From: ko0q_gary
Topic: 7234 Message: 7234

I changed my digital interface to a Microham Microkeyer II and as such I have my SignalLink USB with an Orion II cable for sale. The cable connects the SignaLink USB to the accessory port on the Orion II.

Included is the SignaLink USB, Orion II cable, and USB cable. I don't have the printed manual or software disk as I just go to their site and get the newest editions. Cost is $50 shipped to Continental USA via PayPal or USPS Money Order.

Gary KO0Q

7235. 566 block diagram with connector info

Yahoo group: orion565 (2009 — 2013)
Date: 2011-10-29 13:52:32 UTC
From: k5ux@rocketmail.com
Topic: 7235 Message: 7235

Does anyone know where I can get a block diagram indicating cable connections between boards. I recently replaced the front panel on my O2 and found there was one TMP connector (I think J17) that didn't have anything connected to it.....I don't remember what the designation was and have tried to locate it via the schematics, but it appears harder than I thought. The front panel replacement went very well and took approx. 2 hours and everything worked as it should when I put everything back together. I'll be glad to share some of the issues I ran into when replacing the panel.

7239. orion2 can't properly select RTTY

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-04 19:35:03 UTC
From: George
Topic: 7239 Message: 7239

My O2 cannot properly go to the RTTY mode when I click on a DX spot that is indicating RTTY. My O2 goes to USB and 2400hz band width.

I'm using DX4WIN logging program to control the O2.

Anyone else notice this?

Is there somewhere in DX4WIN where you can specify that you are using FSK or AFSK? How about in the RTTY program you're using? I never use AFSK with my Orion II, but I suppose that USB is the correct mode if you are. In my case, I'm using WinWarbler (part of DXLab suite) for RTTY and it uses MMTTY as the RTTY front-end. In MMTTY, you specify whether you're using FSK or AFSK. Then in WinWarbler, you further specify the mode as USB or LSB if using AFSK. You're situation will be a bit different, but the idea is the same.

George, does DX4WIN select the rig's mode based on the frequency of the spot? If the RTTY station is outside of the usual frequencies, or if your mode selection file in DX4WIN has been modified, you'd experience the results you're reporting.

i will be leaving this group. After several years of ownership of My Orion ll and my Elecraft K line, I have parted with my Orion ll. Service, support by the manufacture and quality of final product in my opinion have proven over time that Elecraft gets my vote. I will be ordering another Elecraft radio soon and never look back. Its been fun, just not real fun!

Mike;

I triple checked the CW cut-off frequency in the DX4WIN Preferences, QSO tab and they are correct. It does the same thing for PSK31. It always goes to USB every time I click on a spot and the word RTTY or PSK31 is in the notes section of the spot.

All else seems to work fine, frequency and mode, CW or USB and split just as long as there is no RTTY or PSK in the notes area.

DX4WIN is looking at these modes as USB???

Intuition tells me that the RIG file would have something to do with this.

I have an Icom IC-7600 and it works fine for mode and frequency for RTTY and PSK.

Subject: Re: [orion565] Re: orion2 can't properly select RTTY

George, does DX4WIN select the rig's mode based on the frequency of the spot? If the RTTY station is outside of the usual frequencies, or if your mode selection file in DX4WIN has been modified, you'd experience the results you're reporting.

Interesting reply Floyd. I never gave AFSK a thought? I never use AFSK so maybe what you are telling me that USB is the proper mode for a RTTY spot click?

Is there somewhere in DX4WIN where you can specify that you are using FSK or AFSK? How about in the RTTY program you're using? I never use AFSK with my Orion II, but I suppose that USB is the correct mode if you are. In my case, I'm using WinWarbler (part of DXLab suite) for RTTY and it uses MMTTY as the RTTY front-end. In MMTTY, you specify whether you're using FSK or AFSK. Then in WinWarbler, you further specify the mode as USB or LSB if using AFSK. You're situation will be a bit different, but the idea is the same.

Topic: 7242 Message: 7248

Hi All,

I don't know if it's really "sour grapes" or not, but the original post was perhaps suggestive of a somewhat negative view. I'm not sure why the post was really necessary, but maybe this one isn't either! I just feel compelled to defend Ten-Tec a bit, in spite of the fact that I too have defected to Elecraft.

The last two years or so are the first in over 40 years that Ten-Tec has not been my "main radio". Over that period of time I owned, and truly enjoyed, a series of very fine products from Ten-Tec. The last was an Orion II. There were a series of other "Omni's and Corsairs in between.

For me, the K3 is a better choice. It won't be a better choice for many. It certainly wasn't Ten-Tec service that led me to switch, although I think Elecraft has set an even higher standard than even Ten-Tec provides. Nonetheless, I believe anyone with a Ten-Tec radio will be well taken care of by Ten-Tec. In my view, Ten-Tec wrote the book on customer care, and Elecraft just adopted it and has improved on it.

I had preferential reasons for opting for the K3. The Orion II was/is a very fine radio, but Elecraft has worked very hard to make the K3 a better one—at least in the opinion of a lot of folks. Furthermore, they have continually improved the radio, while Ten-Tec sort of let the ball drop for a while with the Orions. The return of Jack Henry may have alleviated this somewhat, but some things I didn't like about the Orion just couldn't be changed by upgrades. Like I said, though, it's mostly personal preference.

Right now I think Elecraft is, by far, the more aggressive of the two companies in terms of product development. What's most impressive is the way they keep tweaking their products with easily adopted firmware upgrades. The new KX3 looks like it will be a smash hit. The K3 has proven itself to be a winner, and the "K Line" shows strong possibilities of becoming a classic somewhat akin to the Collins S line and Drake C lines. I also have the KPA500, and it's a crackerjack amp! The P3, although outboard, certainly runs circles around Ten-Tec's attempts at a bandscope. In my view, the bandscopes on the early Orions were not worth very much. I don't know if they have improved much.

Obviously I favor Elecraft. However, I certainly would not ignore any new offering from Ten-Tec. They make very good products, and they take care of their customers. It all depends on what features you want most, and which product suits you better. A Ten-Tec may be nearly perfect for you. The truth is that there is a lot to choose from out there. Half the banter on many of the reflectors is along the lines of "I wish this radio had this feature like brand X does"! That will never change.

George - I run DX4WIN also with my Orion, connected by a microHam DigiKeyer, and, after a few settings in DX4WIN it correctly selects FSK (RTTY), as that is my choice for that mode. So, it's doable, but I don't know what settings you might need to change as I haven't fiddled with my settings in a long time.

Enjoyed reading Dave's comments. I've got an Orion I and a K3 on the table, as well as a slew of older Ten-Tec radios.

With Ten-Tec bringing the RX-366 to market, it's likely that my Orion I will be my radio of choice. We'll have to see, but that's my hope. The K3 is a fine radio in all respects, except for the form factor - not enough info on the small display, too cumbersome to change some of the settings (e.g., BSET etc).

I also think Ten-Tec product development is a bit more active than you give them credit for. With Elecraft stating categorically that they have no plans for a bigger form factor radio, my attention is toward Sevierville for my next dream machine. I just hope they don't make the mistake of thinking the market wants them to shrink the display/knobs/buttons of the full-size Orion.

From: George
Topic: 7239 Message: 7252

Mike;

I think I have the answer to my problem. DX4WIN assumes that I am using AFSK for RTTY which is not what I'm using. I'm using true FSK. DX4WIN Orion rig file apparently has never been updated to allow RTTY to be the preferred mode when clicking on a RTTY spot.

Now to get the Orion RIG file updated.

George W2YJ

Floyd;

I'm using MMTTY in the true FSK mode with my Icom IC-7600. I won't even wire the Orion 2 to use RTTY until I can get a rig file that will set the O2 to RTTY when clicking on a RTTY spot. No sense going through the pain of making up an interface box if I can't click on a RTTY spot and the O2 is set to RTTY and not USB.

Thanks

George W2YJ

Is there somewhere in DX4WIN where you can specify that you are using FSK or AFSK? How about in the RTTY program you're using? I never use AFSK with my Orion II, but I suppose that USB is the correct mode if you are. In my case, I'm using WinWarbler (part of DXLab suite) for RTTY and it uses MMTTY as the RTTY front-end. In MMTTY, you specify whether you're using FSK or AFSK. Then in WinWarbler, you further specify the mode as USB or LSB if using AFSK. You're situation will be a bit different, but the idea is the same.

From: ab5wg
Topic: 7254 Message: 7254

I have a difficult decison to make but must reduce the size of my radio collection. I am the original owner of this ORION II. It has all filters and the Automatic Antenna Tuner installed. I also have the Ten Tec digital interface to go with the transceiver. Original box, manual and the "stuff" that came with the radio is included. It is spotless and has never caused any problems nor been back to Ten Tec for service. It has been pampered and lives in a non-smoking environment. $3000 shipped to you in the US. Please reply off line not to the list. ab5wg@....

7255. CW Key inputs on Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-08 10:16:16 UTC
From: Barry N1EU
Topic: 7255 Message: 7255

Although I've used the Orion for 8 years, I'd like to use the internal keyer for the first time. There are key inputs on the front and back panels. With internal keyer set to "on", is it possible to connect a paddle to one input for the keyer and cw output from a computer to the other input that wouldn't go through the internal keyer? I suspect the answer is no, but many folks out there probably know for sure.

Thanks & 73,
Barry N1EU

Topic: 7255 Message: 7256

The answer is no. Once you turned internal keyer on, you wouldn't had a chance to use output from computer.
I think this issue can be resolved by implementing winkeyer-like capabilities in Orion firmware. I mean, in this case you might manipulate from computer just sending messages through the serial control interface.

Oops, I had a delayed reaction (hey. it's 6 in the morning) and just "got" Martin's solution - use the Menu option to define cw PTT as "key the rig" for the computer's cw that you feed to PTT input instead of key input. Thanks again!

Barry,
You could connect them that way.
However in order to switch to the manual key,
you would need to reset the kind of keying.

Using the switches on the front panel, simply
turn the speech processor off. On CW this
disables the keyer, allowing the computer to key
the transmitter. Or turn it on and set the speed
to the one you want to use. Probably you can
also do this through the computer interface, but
I have not done this.

Isn't the PTT input a cw keying line and not a paddle input ? Why would
you have to turn the internal keyer off?

7262. 1.0 SWR Rreading

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-09 07:53:16 UTC
From: NewellC
Topic: 7262 Message: 7262

First a little background. I have an Orion I bought 6 months ago used. It works great and I love it. I have been running a Butternut on antenna 1 and a TH6XX on antenna 2. I decided to replace my 30 year old Butternut with a CX Engineering 43 foot vertical. I got the new antenna installed with a SGC SG-230 tuner at the base and put in 4 35 foot radials and then like a kid at Christmas went in to test it. The Beam is on antenna 1 and the vertical is on antenna 2. Everything looked great with the vertical hearing about 1 - 2 S units below the beam. The SG-230 did a great job matching the antenna from 10 to 160 Meters with the highest SWR of about 1.8. Likewise, the internal tuner did a great job on the beam. Good job and I quit for the day.

So, 5 days later I get time and go back and put in 12 more radials for a total of 16 thinking that will be good for over the winter and I will put in more next spring. Then I go back in and do some testing.

I turned on the radio and it is silent. I have no volume on VFO A, but when I switch to VFO B I get great volume. So, thinking something has happened in the radio I do a master reset and TADA, volume is back. Then I note that when I switch to the vertical the band is dead and there is no signal on the trace. The vertical is deaf. Then as I test further I note that every band on both the beam and the vertical are reading 1.0 SWR.

Thinking my SWR reading is wacked out I do another master reset - no change. So I go out to check the antenna connection and the SG-230. I remove the connections and take resistance reading and everything looks good. I pulled the cover off the SG-230 to check the fuse, it was good. I put everything back together, turn the radio back on and now everything is as it should be. Good signals and reasonable SWR readings on both antennas.

My first thought was something at the antenna because I got good signasl on the beam but nothing on the vertical. But then that would not explain why both antennas had no respone to band changes on the SWR meter.

What happened? 1. Why no volume on VFO A? 2. Why the continual 1.0 reading on the SWR meater on both antennas?

I'd probably never set it above 75. If you can hear band noise in the background, it's plenty high.

Here's a 60-second method to gain adjustment:

1. turn RF Gain to 100 and tune in an s9+ station.
2. turn up AF Gain till it's VERY loud, but not painful. Leave the AF Gain setting at this level, always - don't touch it.
3. turn down RF Gain till you can just hear band noise in the background - adjust as necessary when you change bands.

This will provide very quiet reception with signals popping out of silence - maximal audio dynamic range and minimal AGC action,

Agree and if you want to play around with various AGC settings through computer control you can also install the windows program as available in the files menu;

http://f1.grp.yahoofs.com/v1/EKa-Tsa6DDrZn-JJv2McwDchMfO7KSk7mq8IEHYd3S0_8SHvr9l4XFcOtAq2IkyIgOrQzvL3z2qNnlgjwr5UnAlhTnqOkJqcug/pa1ap%20AGC%20program/orion_agc_macro_v20050.zip

I hope the link above works.

Couple of things to keep in mind;

1- the program utilizes a profile which is connected to Orion firmware. Make sure you select the correct version

2- the program allows automatic AGC setting through S-meter routine. But this will only work if the correct firmware version is selected.

3- it is possible to change the threshold in steps of 1uv using a slider. Same for RF gain in steps of 1%

4- there is a small meny which allows you to switch between AGC modes and the AGC user is what will be used by the program.

I am still using the program, just like Barry is sharing but for me it is a click on a button to adjust. All happens within few seconds.

Anyway,just for experimenting and lazy folks like me ;-)

You might have fixed the issue already but below some suggestions and questions;

Can you share which firmware you are using?

Can you disable / enable the internal tuner and do you hear a soft click when doing so?

Can you share the antenna button status and to which antenna the TX is mapped?

By any chance RX Ant also selected (which connects RX to the tulip plug on the back instead of the coax connectors) ?

If you connect a wire straight into the coax connector do you copy any signal or is it still deaf?

Regards, Onno

7272. Orion 565AT for sale

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-12 22:35:53 UTC
From: f_skinner
Topic: 7272 Message: 7272

Well, I have had to make the difficult decision to sell my Orion 565AT. It will come with the matching speaker and the desk microphone (and documentation). I am not a SSB Operator but have had the occasional SSB QSO from time to time. I am the original owner and this was my second 565. It has been in constant use since I got it in 2004 (I think it was 2004 but could had been 2005). Serial number is 10C10414. It has no filters installed as I never felt it needed them as other radios do. I have had absolutely no problems with this radio and it has been the most reliable radio I have ever owned.

I am asking 1,850 and will cover shipping to the lower 48. I will double box pack the radio and will send the speaker, microphone and documentation in a separate box.

My email is f_skinner at yahoo dot com

7273. Orion 566 not following spot clicks?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-13 14:22:35 UTC
From: George
Topic: 7273 Message: 7273

I have done extensive tests using my logging program, DX4WIN, and I'm finding that the O2 does not revert to the proper mode and bandwidth when clicking on a packet spot. For instance, when I clicked on a 24.891.0Mhz CW spot which is split the A VFO goes to 24891.0 LCW 960 BW and the B VFO goes to 24892.4Mhz USB 960 BW??? Comon, I can't send CW in the split mode when the B VFO is in the USB mode. Is it a function of the DX4WIN logging program?

What is going on here?

Can anyone explain?

George W2YJ

Onno,
will this also work with the Orion II?

7275. Re: Orion gain setting

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-13 19:20:43 UTC
From: pa1ap
Topic: 7263 Message: 7275

Yes the program has been written to support both radio's. Something to keep in mind though is the S-meter calibration which tends to vary for each firmware version... don't ask me why TT is doing this. Anyway, there is a small version selector upper right corner, just scroll through and check if "566 O2 xxx" matches your firmware.

If it does, great. If it does not, just realize that the auto s-meter routine might not understand the actual s-meter reading related to RF gain / threshold. Thats all... have fun playing and let me know if I can help in any way. If you have a version which is not supported let me know and perhaps we can quickly create a firmware profile. Takes 30 minutes or so to build.

This is software used to explore the AGC functions. All I was doing is experimenting how threshold could be lifted above the band noise and what result this would have. Since the threshold steps on radio are a bit challenging to adjust the slider will allow very easy adjustment ;-) There is a small (green) marker / connector between Threshold and rf-gain which you can disable to decouple rf gain from threshold if you like. If you like the whole range click on "zoom" or if you want the area between s2 and s7 click on "full" or otherway around. I dont recall anymore.

anyway, to much communication on the program already. Just install it and play around with it ;-) 73 onno pa1ap

I would not be suprised this is the KTDT bug. Do you have the means of providing a serial trace? And what is the effect if you activate a function twice? Does it work second time?

7277. O2 does not change to correct mode when clicking on a split spot?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-15 01:17:53 UTC
From: George
Topic: 7277 Message: 7277

If I click on a packet cluster spot that is CW and split the A VFO goes to 800Hz, my preference and CW mode but the B VFO if it was in USB mode it stays in USB with 800Hz.

What is going on here? Can anyone shed some light on this. I have no problem with my Icom 7600 going to the correct Mode and BW.

I am using DX4WIN logging program with a rig file "ORION.RIG:.

Thanks.

George

Sounds like DX4WIN isn't outputting the necessary commands to properly set up vfoB. Other logging programs (N1MM etc) do this fine with the Orion. I haven't personally used DX4WIN however.

Barry;

I believe you are correct. I also wrote a note to the DX4WIN reflector.

Thanks.

7281. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-18 14:18:29 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 7281

Enter your vote today! A new poll has been created for the
orion565 group:

For Orion II owners: When operating CW, one of the relays
in the Orion II makes a distinct ticking sound on the trailing
edge of dots and dashes. This relay follows the keying even
100% delay selected and can be quite an irritant. Some report
little or no relay noise, while others can hear it in the next
room. What is your experience with this relay noise?

o I don't operate CW
o I don't hear the relay noise when keying
o The noise is barely audible
o The noise is loud enough at the operating position to be irritating
o The noise is loud enough to be heard in the next room

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13111744

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

7282. Filters for 565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-19 10:15:15 UTC
From: Per Bekker-Madsen
Topic: 7282 Message: 7282

Hi
Anyone with knowledge of the difference between the TT 1.8, 400 and 250 stock filters compared with the Inrad versions of same? When I look at the skirts of the filters there is a big difference in advantage of the Inrad filters. E.g. the 250Hz has a BW6 on 455Hz on the TT stock filter and Inrads shows BW6 on 315Hz comments will be appreciated before I order these three filters.

TIA

OV2V/OZ1EQC

Per, you will notice no difference in performance between the Inrad and TT filters in the 565. These are roofing filters and only need to provide perhaps 20-30dB of attenuation such that the hardware AGC isn't triggered by s9++ off-channel signals. Once that is achieved, the dsp filtering does the rest.

Many savvy 565 users do not use the 500 and 250hz filter slots because those two filter slots involve an extra stage of amplification in the 565 and cause excess IMD. Instead, they install the Inrad 600hz filter in place of the Orion's stock 1Khz filter. The 566 Orion II corrected this problem by using filters in those two slots with fewer poles and less loss and eliminating the extra amplification.

From what i understood the two 500/250 Hz filter positions utilize an additional amplifier to compensate for filter loss which impacts imd. Some cw enthusiast slap in a 600 Hz filter into the 1khz position and this works well. Smaller bandwidth through dsp filters.

Hi Barry & Onno

Tnx for the information, will order that 600Hz Inrad filter :-)
Saved me lots of money and irritation (I do only work CW)

You want the Inrad 762 filter, not the 763 filter.

7289. Ten Tec- orion II 566AT for sale or px

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-20 16:11:28 UTC
From: chris
Topic: 7289 Message: 7289

Ten-Tec Orion 2 566AT...

Sorry to place this post but my prized radio is too big now for my shack.
I have to let it go.

Looking at part exchanging / swapping my radio for smaller.

The Ten-tec is perfect and comes with the built in ATU and ssb filter fitted.
I will send out pictures to serious interest only.

My shack is a lot smaller now so has to go
This radio has all the original included kit with leads and manual..

Would prefer to show it working before any deal .
Grab a bargain at £2500.00 or px etc
I will not negotiate the price sorry but it is cheap for this radio.
Collect or arrange currior collection .
Thanks. M0ZOL Zoli Plymouth U.K.

7290. Poll results for orion565

My guess is that they read the description of the yahoo group and saw that it covered both. Sometimes you get that idea that radios have all kinds of problems. It might be that those with problems are the most vocal. I see that with most appliance operators such as maytag users :) I never had a problem with the o2 but didn't get a chance to participate in the poll. I think ten tecs are great. I can give more praise when I receive my complimentary O3...

I took part in the poll, and all I can say is if you find a better, absolutely quiet and efficient QSK switching, along with the multiple other features for CW ops, then let me know. Jim is right. I have had all the high end rigs, and the Japanese rigs beat the Ten Tec in finish and "feel" but when it gets right down to performance, the high end Ten Tecs are the best. Could the good folks at Ten Tec spend some more money on "finish", or should they compete with the "trophy wives" rigs who look good, but don't deliver, and charge more for looks??? I will take performance every time! C'mon folks, you don't have to put a bag over the rig to work it!!. Nuff said.

I agree 100% with everything you say, but I'm not sure what the purpose was in taking a poll about the noisy relay. I haven't seen the results yet, but it really doesn't matter because from my standpoint every Orion I've ever owned (all ONE of them) has an annoying chirpy relay. But that in no way means that I would trade it for any ken-yae-com on the market today. It's fun and easy to operate. If my wife doesn't like the noise, she can turn on her embroidery machine that sounds like a Model-T and drown out most of it!

Long live Ten Tec!

7295. Re: Filters for 565

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-22 03:42:42 UTC
From: rdepierre
Topic: 7282 Message: 7295

I think I'll take issue with the statement that the 565 uses lossy filters that requires an extra gain stage that causes extra IMD.

I remember reading the ARRL review just after the 565 came out many years ago. It included a statement that said something akin to what was repeated above. It's the IMD part that I take issue with.

Yes, the narrow filters have more loss than wider ones (actually 7.6dB for the 8-pole 500Hz filter). And yes, there is an extra gain stage to make its insertion sound seamless (gain equal to the filter loss). But that gain stage is located after the first mixer, which causes the overwhelming amount of intermod distortion. That gain stage doesn't cause any distortion by itself, but can cause it at the next distortion block down the chain ☐ at the second mixer. It's just not possible for any distortion caused by the second mixer to be anywhere near as high as that caused by the first mixer. I don't buy the statement that gain stages in the filter chain cause any measurable IMD.

My position is that the filter architecture of the 565 is far superior to that of the 566. In the 565 you have two banks of cascaded filters (the second bank requiring said amp). All of the filters are 8-pole types. The 566 uses a single bank of filters, all of the 4-pole variety.

We all know that 8-pole filters are better performers than 4-pole filters. The transition band is a lot steeper, and the stopband is deeper. It's always that way, unless you build them wrong. When filters are cascaded, the performance multiplies. Two 8-pole filters cascaded give the approximate performance of 16-poles. 8-pole filters also cost more, usually more than double the 4-pole counterparts.

I think the ARRL test unit was received early and hurriedly put together, and they neglected to tune the narrow filters. Remember the 565 design followed quickly on the demise of the Omni VI, whose narrow filters were used in the 565, and off the IF frequency by 750 Hz. The user must tweak those filters to get them lined up properly. If you don't get it right, you get performance data that looks a lot like what ARRL talked about in their review. I have measured a number of 565 and 566 transceivers, and have never found the narrow filters in the 565 to decrease the IMD one little bit.

TenTec's claim that they improved the performance by making the filters cheaper is pure advertising hype. Otherwise, would you like to pay more and get less?

I don't care how good their DSP filters are (and they are very
good), the crystal filter transition band does count. And the stopband
depth does count. A 95 dB dynamic range is meant to protect against
signals up to S9+40. Signals this loud are almost enough to start a
fire in my first mixer. In CW DX contests I hear wall-to-wall signals
this loud. At S9+41 I'm dead meat. If I'm going to slug it out
with the big boys, I'm not about to throw some anemic 4-pole filters
at the problem.

Yes, the crystal filter transition band counts but only until there's sufficient attenuation such that the dynamic range of the ADC isn't exceeded. All that's needed is 20-30dB attenuation on signals that are s9++. DSP filtering does the rest.

You don't need cascaded filters and 4-pole filters are almost always enough. Ten-Tec (with the 566) and Elecraft (with the K3) both reached this conclusion.

DSP i.f. radios with roofing filters have completely different crystal filtering requirements when compared to analog i.f. radios.

7297. Orion II - noisy relay poll

Yahoo group: orion565 (2009 — 2013)
Date: 2011-11-27 15:33:54 UTC
From: floydsense
Topic: 7297 Message: 7297

Thanks very much to the 27 other Orion II owners who responded to the poll. I think it's clear that the relay noise amplitude varies quite a bit across units. From searching the archives of a couple of forums, I see that others have made attempts at quieting the noise with mixed success. I'll report later on what I'm able to accomplish in reducing the noise. Here are the poll results:

POLL QUESTION: For Orion II owners: When operating CW, one of the relays in the Orion II makes a distinct ticking sound on the trailing edge of dots and dashes. This relay follows the keying even with 100% delay selected and can be quite an irritant. Some report little or no relay noise, while others can hear it in the next room. What is your experience with this relay noise?

CHOICES AND RESULTS
- I don't operate CW, 3 votes, 10.71%
- I don't hear the relay noise when keying, 10 votes, 35.71%
- The noise is barely audible, 8 votes, 28.57%
- The noise is loud enough at the operating position to be irritating, 4 votes, 14.29%
- The noise is loud enough to be heard in the next room, 3 votes, 10.71%

7298. TenTec Coffee cup wanted.

Yahoo group: orion565 (2009 — 2013)
Date: 2011-12-02 02:16:38 UTC
From: Frankie
Topic: 7297 Message: 7298

Anyone have a spare TenTec coffee cup? (or two) I broke my cup and need a replacement. The current cup that TenTec sells is slightly different from the old one. The new one has a thinner lip and doesn't feel like my old one, which got busted. I miss my old cup and hope someone has one (or two) that they would sell. (the old one says "America's Finest" below the TenTec logo, that's missing on the new cup)

I've been using this cup exclusively for the past 5 or 6 years and would like to get an exact replacement (and a spare if available). It's a long shot but it doesn't hurt to ask!

Thanks,
Frankie

From: Sugar Bear
Topic: 7299 Message: 7299

I just started having a strange problem, and am sure it is just operator error, so was hoping another Orion II operator could assist.

My main frequency changes in 5 Hz increments. Trying to get to 3.737 and the closest I can get is 3.735. I can make the adjustment fine on the sub-receeiver. When I twist the VFO A it makes 5 Hz jumps.

I went to the menu, selected "step" and "1 Hz" but no change.

Anyone had problems with headphones/loud speaker ???
Soudenlly audio disapear or a series of scratching noise appear in the headphones.
This defect heppen, sometimes, also using loud speaker.

The rig has been alreday reseted and i also tried differents firmware....

No way, Time to time this defect appears....

Who can help me?

Similar experience for the chassis speaker connector. It made poor contact and moving the plug a little caused scratching noise and often lower audio presence. I still need to replace the connector. I cleaned contacts but it seems more lack of contact pressure than dirty contacts. I will order replacement connector as well battery since it is about to expire on me :-) regards onno

Make sure you have the input source set to "MIC" or "BOTH" in the SSB menu and the mic gain is adjusted to a level just short of causing the ALC red light to blink on audio peaks.

Is your audio (if you had any, that is) going into the Orion via the mic plug or the AUX-IN connector on the back? The reason I'm asking all this is that for about the first year after I took ownership of my Orion I had the same problem. No matter what I did I could not transmit audio through the AUX-IN connector. As it turned out, I was trying to use it in VOX mode and not PTT. Everything started working great when I connected the PTT/CW input to my USB Signalink. For what it's worth.

Thanks I'm using the mic input and when I energize the Orion to transmit manually the audio is all OK . However when I do so with HRD the transmitter will go into xmit but no audio from the mic.

Wait I do not have it connected to the Signal link, I don't have the right connector all I have is an Icom connector, wonder if that would work?

Thanks Tim

7330. Orion SSB rcv audio

Yahoo group: orion565 (2009 — 2013)
Date: 2011-12-06 15:23:38 UTC
From: Paul DeWitte
Topic: 7330 Message: 7330

My Orion has the latest firmware 2064X11. On SSB the receieve audio leaves something to be desired. No one sounds natural. Playing with PBT does not help (that fixes it on my CII).Most sound higher pitched like you are off freq. But that is not the cure.

Is there something in the firmware that I can change to make it sound better?

Any suggestions?

Thanks,73

Suggestions:

1. Make a recording and post the file to
http://groups.yahoo.com/group/orion565/files/ so we can hear what the
issue is and comment

2. Do a master reset of your Orion and see if the problem is resolved.

3. Does USB and LSB both sound the same?

What are these settings: width, RX EQ, PBT?

The Orion ssb rx audio should sound fb to even the most picky listener.

Barry N1EU

Hi Barry, I had not played with the RCV EQ. At minus 15db it sounds much
better on both USB and LSB. Should have just read more in the book.

Other than a couple of things that I would change if I designed it, it is a
great radio.

Thanks,73

7334. Connect MD2 Mic to Orion?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-12-09 14:39:26 UTC
From: John Huffman
Topic: 7334 Message: 7334

I would like to connect my Elecraft MD2 desk microphone (made by Heil with the ic electret element) to my Orion 565.

The Orion pinout -
1 - mic
2 - mic ground
3- PTT
4 - 9v
Shell - ground

The MD2 pinout -
1 - mic
2 - PTT
6 - 8v
7 - ground
8 - ground

I hooked the mic connections together Orion 1 and MD2 1.
I hooked the grounds together Orion 2 and shell, MD2 7 and 8
I hooked the Orion 9v pin 4 to the MD2 8v pin 6
I'm not using the PTT

I get no audio out of the Orion while listening to the monitor.

I checked continuity on all my connections. I hear the audio from a dynamic ten Tec 701 mic fine on the Orion monitor, so the Orion connector seems to be working. I measured the 9v on both connectors to be sure that was hooked up. The MD2 works fine with the K3, low gain and bias on.

I'm stumped....

Hi all,

I have just got an Orion-I which had some power supply troubles.
After fixing them, I am now the proud owner of a working Orion-I :-)!

It is serial 06C10xxx and has the v2 mod done. Installed firmware is
2.059d. Am I missing lots of nice goodies compared to latest
firmware?. Should I upgrade to the last one?. Is there any worth
noting bug on the last version?

Thanks for your help!

Best regards,

JOSE

Hi,

As far as I know Pin 2 is actually negative side of -floating- mic circuit. It is not the same as DC ground.

I am not sure how you measured the voltage on pin 4? I would be suprised if the 9V exists between pin 4 and pin 2. You would find it between pin 4 and chassis... With current wiring do you measure DC voltage over (-) / (+) of electric?

What you have to do is ensure the electric will get its DC power as well the mic circuit is driven correctly.

In theory your mic should be connected in floating manner to pin 1 and pin 2. Mic bias current through resistor between pin 4 and (+) electric. Capacitor from pin 1 to (+) electric as well capacitor from pin 2 to (-) electric. The latter would be a bit weird since you need to ground the (-) electric and as such you would have pin 2 with capacitor to ground. I doubt if thats needed or makes sense.

Unfortunately I do not have electric to test otherwise I would have been able to provide better information. I googled but there seems to be little information on connecting electric to balanced circuitry.

I expect hum to become the next challenge. But first get some audio passing through the cable into the mic circuit :-)

Onno -

I found my answer on another list. I had failed to put a 4.7K ohm resistor between pin 4 and pin 1 for the bias on the electret mic element. I then hooked the MH2 pin 1 to the Orion pin 1 and the MH2 ground pin 2 to the Orion ground pins 7 and 8.

It works great with good audio reports.

Thanks for the info and the help.

Excellent! I just checked schematics and your setup should indeed just work. I always assumed symetrical connection but within the rig a 100k potentiometer is used and center connects to capacitor to decouple DC from mic amplifier. Your setup provides the DC bias to mic and won't harm the internal amplifier. I should have checked schematic before replying.... anyway you got it to work and that's most important. Best regards onno

Looking for late model (2011) ORION 2, but will consider others. Please email information including price,thanks.

7343. Orion 565 cw sidetone frequency

Yahoo group: orion565 (2009 — 2013)
Date: 2011-12-21 03:10:25 UTC
From: chasnels@bellsouth.net
Topic: 7343 Message: 7343

Just received my first 565 a few days ago. So far, I like it!

The radio has the 2.064 firmware installed.

I have noticed that after transmitting FSK, if I switch to cw mode via a band stacking register or a memory channel, the cw sidetone frequency has shifted to the FSK monitor tone frequency. If I manually set the mode to cw, the sidetone frequency returns to normal. Has anybody else noticed this?

Chas, N4FW

Yes, I've seen the same behavior. I don't know if a later level of firmware will correct that or not.

Exact same problem here. Measured the -20.5VDC output voltage on the A9 board and it was down to -17V, lower when transmitting. I replaced capacitors C1 thru C-5 and now the display comes up immediately when powered on, and is rock solid during cw. I used RadioShack capacitors just to see if that would solve the problem. If it happens again I'll know where to look. Good luck, 73

Yes, I have heard some issues requiring some component changes to solve. In my case, my issue turned out to be all external. Ultimately I tossed the factory power cable. A new connector with heavier gauge of cable x four feet long and presto; my Orion has been solid as a rock ever since in any mode at any power setting.

Someday if I have to take the radio down for some sort of service, I will eliminate the factory power connectors and fuse holder. At this time I am thinking more along the line of a chassis strain relief with xx inch length of cable exiting the rig into an ANDERSON power pole with shell locks that keep the mating halves held together. A pair of ferrite cores with quality in line fuse holders on each line will be on this pigtail.

While most people probably prefer a rear panel connector, I am leaning toward this plan.

Meanwhile this rig absolutely blows me away re how well it works. Sort of like learning how to drive a manual transmission. Wrong gear and/or slip clutch too much or not enough, not the optimum results. Once I learned how to really "drive" this rig, nothing else will do!

I have had both issues with the power distribution board and the factory moles connector.. Did the repairs on the board myself (look up K7HP and N6IE for details) and replaced the 2 cent connector with a hardwired power cord. The pins in the molex spread apart and had been arching and was building up resistance.

If I ever have to take the rear assembly apart again, I'll replace the connector with power poles too

Glad you got it resolved.
And yes, I went with the pigtail cable with the power poles on the end. I made it about 12" long and secured it with a cable clamp. Works great. I was a little nervous about having those rigid power poles sticking out of the chassis for fear they might get hit and break the PC board.
Ditto to all your other remarks! Great radio.

7349. Orion 565 change to mic circuit pre / post 2004?

Yahoo group: orion565 (2009 — 2013)
Date: 2011-12-30 23:37:49 UTC
From: pa1ap
Topic: 7349 Message: 7349

Greetings,

Can someone advice on the actual change applied to the mic circuit on the 565? The tentec wiki provides conflicting information as well does not explain what actually changed.... I know pin 2 is either connected to chassis or not... any factual information when unit is pre / post mic change? As well what actually changed?

Thanks and best regards, Onno de pa1ap

Hello, I purchased and older Orion 2004 model and I'm not sure what kind of mic to use it came with a Ten-Tec 705 Mic. One question I have does the 705 need the 9 volt battery in it to work with the Orion.

Also came someone reommend a newer style mic for the Orion.

Regards - Alan

I've used the Heil HM 10 dual w/ the HC 5 element, and I'm now using the Heil Goldline Broadcast element. With the eq built in the radio you can make pretty mcuh anything sound good in my experience.

Topic: 7352 Message: 7355

with regards to the need of 9V battery I get the impression from the connector diagram this is not needed;

http://tentecwiki.org/doku.php?id=705conn

I guess it is easy to test... Just connect the mic without having 9 V battery installed. If it move the pwr meter / ALC you should be fine ;-)

The orion does provide a mic voltage and it should be possible to modify the mic to source power from the mic connector if it doesn't work out of the box.

I am using the TT 708 mic which is a good microphone. But keep in mind that the 708 does not have the 13dB amplifier and as such you would need to raise the mic gain to compensate for this....

Starting release 2 (for 708 mic) the mic settings should be around;

1- mic gain at 50 (default)
2- mic potentiometer at default setting (dont need to change)
3- hw mic gain at 15 dB

That would make it on par with your existing microphone. With earlier versions you would need to put mic gain at 100 and turn up the potentiometer to maximum to get enough umpf in your audio.

hope this helps, Onno pa1ap

Alan,
I am assuming that you have the 565 instead of the 566. I have a 565 and use the 705 regularly. The transmitter or the speech processor will supply the necessary voltage without a battery. I also have a Ten Tec 709 desk mike but rarely use it any more. The stand tips over easily and it may damage your mike. If you use the 708 or 9, you may want to tailor your audio to reduce the bass.

Good luck,
73,
Ed, N5EI

Greetings,

I am writing orion back and restore program and looking for couple of operators who would like to test the program. At present it is windows based control and you can store multiple backups within the backup file.

Let me know if you are interested and on what windows version you will run the software. Second, please advice orion type 565 /566.

Regards, onno

I have an Orion565 running on Windows7.
I have no success in installing the above mentioned program.
The installation procedure prduces the following error:
SystemInvalidOperationException.

Can anybody help?

Hello,

I might be able to help but need to know more background. Please send me an email with screenshots and or captures of the error messages. Also if the installation triggered a session towards microsoft to download microsoft modules. I know a few people using the program on windows 7 but their environment might be different. I can compile a new version with different settings but appreciate if we can figure out root cause.

Best regards, onno

Hi Onno

Tnx for the programme, ran the install afterwords the programme. Everything
worked fine.
Took a backup of the 565 went fine.
Did a master reset of the radio, and made a restore (didnt delete memory
inf first attemt. The radio inediately went back to the settings I had
before the Master reset, so everything worked fine.
Just needed a "Finished Restore" you can continue message ;-)
The memmory back buttons are grayed ot, so cant perform a memory backup.

Kind regards

Hi Onno

A good advice is to ask all before they start, that they check Windows update and install all the updates available. Especially .Net and the Framework updates.

hello Per,

Thanks for feedback. I will include the restore complete confirmation in next release. The memory backup requires a bit more thinking as there is no direct command for it. It is multi stage sequence and a bit complex to build.
In other words; work in progress and not enabled yet.

The main challenge with serial control is the asynchronous behavior and there is no relationship between request and response. this is fine when its a single handshake. It becomes intriguing when a handshake is out of sync or is part of a sequence...

Anyway, thats fun to work on. And I learn a lot from it ;-)

best regards, onno

Ok willb take that onboard too. In previous compiler this was an option enabled but I was forced to install a clean compiler and lost that setting. When clicking on the install.exe the installer did do a scan of the system for dependencies. I will investigate how I can enable that. Cheers onno

:-) I know - the best way to learn is to mess something up, and figure out
how to get it to work again :-)
Anyway, The user interface of the program is very good, within a few
seconds, I knew and understood how to use it, actually the look of the
program was self explaining.
I like it, and I really look forward to get into the next step :-)

All the best

Onno,

I installed you program and would like the option of where I save the files. Did I miss something on the install? I keep all of my data files on my D drive and I have no idea where your program installed. I can only see as far as \Roaming\Micro on the properties screen. I see where the data is in my User etc. on my C drive. I have a 565 with the standard receiver. I am running Windows 7 32 bit.

Thanks for the routine.

73,

John

Onno -

Install went fine on the second try.

Backup and restore work fine.

Not sure what the "REF:" box at the top is.

When backup is finished the red text says back up "will be" written.
Should say "was" written. I had to check to see if it was created.

Great utility Onno! Thanks.

To be honest I don't know where the config file is stored on your system ;-)

Within the windows development environment there is a variable which will create the automatic link to my documents. In your case this isn't there or does not match the condition.

Could you do a search for the following file name: Orion_backup.txt

It should be stored on your system...

Please let me know your findings and I am thinking how I can facilitate your request. Not to difficult to do but it just needs some planning.

Regards, Onno

7376. Re: Backup and restore explained

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-08 21:33:14 UTC
From: pa1ap
Topic: 222 Message: 7376

Hello John,

Hope you don't mind but I changed the subject to make it easier for other to pick up.

Aha... yes there is no manual nor instructions provided. Wanted to wait until the software was getting a bit more stable and complete ;-)

below the motivation;

1) when you create a backup the program will check if the "Orion_backup.txt" file exists... if not it will create one... if it exists it will append a new record* into the "Orion_backup.txt" file... Normally the file will be stored within my documents.

2) a new record is a single line within the "Orion_backup.txt" and represent all objects as captured during a backup sequence. PLUS three special objects at the start of the line.

3) the special objects are: time stamp, Backup ref:, orion fw version. Those objects are included to make it easy to select the backup record you want to restore and the "backup ref:" is just a field you can use to make a mental note... something like; contest 80m band.... you can also ignore it and it will be empty..

Try it -> before hitting Backup Orion, just provide a short note into that " backuo ref:" field... Then hit Backup... when its completed you will find the latest record to reflect your note...

4) The backup objects window includes a translation of the values learned. @KVABA Main RX: VFO A Sub RX: VFO B TX: VFO A

This is work in progress where I am working on a compare function between different backup records. Why? well first of all because its fun but more important because it allows easier troubleshooting when one operator finds an issue (called a bug) and nobody can replicate the issue.... Taking the troubled config and compare it with another config will give a quick hint towards differences. And since I was typing those silly commands into the program I figured including human language was going to make it easier.

And now on the red messages; yes fully agree I need to become more accurate on the wording. Will pick it up in the next release. For now just assume when the buttons become selectable again either backup or restore is completed.

Hope this helps, Onno

And you would like to be able to select any directory on your system instead?

here is the challenge; when installing the software it will go into some directory. I can include a local config file into the installation directory. It will include the default directory reference. Would it be alright if you manually edit this config file to match your desired directory? This way I don't have to make the program more complex with config buttons etc.

regards, Onno

7378. RE: [orion565] Re: New file uploaded to orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-08 21:51:37 UTC
From: John T. Fleming
Topic: 222 Message: 7378

Onno,

I had no trouble finding the Orion_backup.txt file. But it is not where I would like to put it. It is on the C drive. I would rather have it on the D drive in my setup. I would also like to have it in a folder like My Documents\pa1ap and have the date time or some name of significance for clarity on doing restores. In the meantime, I can move the file and rename it after moved.

Thanks for the work.
73,
John

Subject: [orion565] Re: New file uploaded to orion565

To be honest I don't know where the config file is stored on your system ;-)

Within the windows development environment there is a variable which will create the automatic link to my documents. In your case this isn't there or does not match the condition.

Could you do a search for the following file name: Orion_backup.txt

It should be stored on your system...

Please let me know your findings and I am thinking how I can facilitate your request. Not to difficult to do but it just needs some planning.

Regards, Onno

From: pa1ap
Topic: 222 Message: 7379

Next release i will have the config file included. I just made the other changes as requested. Its now at release 1008.

Please keep in mind the program does not know you moved it. if you move it you will loose the incremental backup /restore record selection. This because the program is stuburn and will create a new backup / restore file.

Never gave it much thoughts on nice directories and such like but will do now.

regards, Onno

7380. New file uploaded to orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-08 22:44:36 UTC
From: orion565@yahoogroups.com
Topic: 222 Message: 7380

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the orion565
group.

File : /BR setup 1008.zip
Uploaded by : pa1ap <pa1ap@...>
Description : Backup and restore version 1008

You can access this file at the URL:
http://groups.yahoo.com/group/orion565/files/BR%20setup%201008.zip

To learn more about file sharing for your group, please visit:
http://help.yahoo.com/l/us/yahoo/groups/original/members/web/index.html
Regards,

pa1ap <pa1ap@...>

7381. Backup and restore v1008

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-08 22:48:36 UTC
From: pa1ap
Topic: 222 Message: 7381

Included confirmation backup and restore completed. Improved the restore record area to only allow restore when a record is selected (record changes blue). Fixed a minor timing challenge.

Pending;

1) local customization file with directories and prefered com port
2) memory bank backup
3) backup compare mode

Best regards, Onno

Topic: 7364 Message: 7382

Hi Onno,
Thanks for your prompt reply. By trying to install the program, I got a single message which I add to this mail. the only error message in the list is
the SystemIvalidOperationException.

Above is the only message I got when I tried to install the program. All items in the message were Ok except the indicated ones.
So far I had no problems with Windows7 on the Orion. I'm running Version 2.064X11and also use a Signalink USB Sound card
interface with MixW3 and HRD.
Thanks in advance for your help.

Also if the installation triggered a session towards microsoft to download microsoft modules. I know a few people using the program on windows 7 but their environment might be different. I can compile a new version with different settings but appreciate if we can figure out root cause.

Downloaded V1008 08.01.2012 23:38
Installed perfect.
Backed up perfected writing where it has stored the txt file.
Made a master reset.
Restored the backed up file
It finalized with prompting Restore ended :-)
Everything went 100%

Tnx Onno

Per OZ1EQC

Installed and ran it on a Laptop with Win 7 Pro 64Bit

Same result

good news Per! Happy that it works and thanks very much for testing and providing feedback.

Working on the next release and including more objects (right now at 62 objects) as well to create a reliable memory backup sequence. Right now the latter will first of all mute the receiver, copy mem#1 to VFOA, perform backup VFOA and create the association within the backup index. Next mem#2 etc...

Right now each step is scheduled at 150mS and this translates into 450mS per memory location backup. 200 x 450mS = 90000 mS for VFOA...I am not sure if thats to long or not... can push the scheduler to go faster but not sure how orion will appreciate that.

Restore of memory pretty much same sequence. Push mem #1 frequency to VFOA, push command to copy VFOA to mem#1. than repeat 199 x.

Is anyone using memory bank at all? Is it worthwhile to do and is it acceptable to wait for 180 seconds to perform backup VFOA & VFOB?

p.s. I need to check if its 200 memory positions for VFO A and 200 memory positions for VFO B... or if it is shared 200 memory positions. Will find out soon.

Hi Onno,

I would be glad to help and have two Orion IIs (566AT)and run Windows 7 professional w/ i7 processors (64 Bit) and one windows 7 home premium netbook (32 bit). I have been a member of both TTBUG beta groups(original and V3).

Please let me know if I can be of use to you.

Thanks again for the GREAT PROGRAM!!
Kirby, K7EC

Greetings,

I am writing orion back and restore program and looking for couple of operators who would like to test the program. At present it is windows based control and you can store multiple backups within the backup file.

Let me know if you are interested and on what windows version you will run the software. Second, please advice orion type 565 /566.

Regards, onno

Hi Onno,

I installed and run the BR program (both Backup and Restore), but the
error remained the same.
I add the screeshot as attachment.

I just installed B & R v1008 on iMac>Parallels>XP Pro w/Svc Pk 3. The install including Visual Basic and XP restart went smoothly and program worked first time.

Simple and intuitive to use. I installed and ran it while in the middle of a CW QSO.

VERY nice Onno!!!!

Berry,

You have to remove the bottom panel. The pot is facing down and located below the Main AF knob, back about an half inch from the front panel edge. It uses a Phillips screw driver. I drilled a small hole something like the hole for the mike gain pot. I may adjust it once a year or so. It is usually related to a software change. I make sure the menu setting is at 50 percent first.

73,

John

Thanks John! And that adjusts the backlight (which is what I need), rather
than the contrast?

Barry,

I am not sure to tell the truth. When I look at the menu, I see “Contrast.” On some version of the software, I had to change that to something like 40 or 45 % to have a bright screen. By adjusting the menu to 50% and then adjusting the pot, it was bright again. I just looked back through my Orion manual where I also keep any invoice of work done by Ten-Tec and I see that they replaced the pot on one visit. They called it a “contrast trim pot.” So it may not be actually what you are looking for.

John

7397. Tuning knob friction adjustment

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-14 16:30:08 UTC
From: Barry N1EU
Topic: 7397 Message: 7397

With the knob friction set as loose as it will go on my 302R remote pod, the friction is still too high for my liking. Does anyone know if the knob assembly can be opened up and the friction clutch adjusted to change the range of adjustment? I believe the knob assembly is the same design in Omni VI and Orion.

Thanks & 73,
Barry N1EU

7398. Re: Tuning knob friction adjustment

It is the same.

Remove the rubber ring and you will find an allen set screw. Basically you will be loosing up the set screw and moving the knob higher on the shaft.

Here is what I did to get the proper feel, as I also like a light touch: Set the knob adjustment to max stiffness, then loosen the set screw. Once the knob moves freely on the shaft I sat the knob to where it barely sat on the pod. I tightened the screw and then I could back off of the adjustment to my desired feel.

According 565 schematics contrast and back light are different circuits.

Contrast control is a combination of a potentiometer and menu based contrast control. The potentiometer is actually connected to the contrast pwm signal as controlled through the menu. The pwm signal is fine tune of rough potentiometer voltage.

Backlight control is not provided through potentiometer. Backlight control is again a combination of fixed voltage and optional pwm control from cpu.however the pwm control is not provided.

Easiest to include an 8 ohm resistor and than adjust contrast through potentiometer. The additional resitor will lower the brightness a littlle and hence the contrast ratio will improve. It also addresses the ghostbpixel challenge.

There is a document available within the file section.

Hope this helps, onno

Thanks very much Onno. I'm looking at your excellent PDF file now. In the beginning you have a photo of two screens. The screen actually gets brighter when you reduce the back light?

It looks like that indeed but keep in mind camera might have adjusted to light conditions. But from my observation / situation I confirm it looks brighter. This might have to do with improved contrast ratio. Hope you find similar results.

Wow, really, Barry? Mine is real nice and loose, spins quite nicely in the loosest position.

If it's not, I wonder if there's some other problem. It shouldn't bind on the housing at all, so I can't imagine how it can be affected by loosening the set screw.

7403. Anyone recently replace an Orion 565 LCD?

Yahoo group: orion565 (2009 — 2013)

From: Barry N1EU
Topic: 7403 Message: 7403

Has anyone recently had their Orion LCD replaced at the factory? My understanding is that you end up with a blue screen with display options of white letters on blue background or blue letters on white background, is that correct? I'd appreciate it if someone could email me some photos of what the new display looks like in action and how it blends with the black front panel.

Thanks & 73,
Barry N1EU

7404. Orion Backup and Restore final version V2000

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-15 19:00:27 UTC
From: pa1ap
Topic: 7404 Message: 7404

Greetings,

I have been busy whole day and previous night to iron out some of the challenges within the code and Happy to announce the final version of Orion backup and restore program.

The following functionality is provided;

1) Configuration backup with the option to include a unique label prior to writing the backup record into the config backup file.

2) Configuration restore with the flexibility to pick any of the previously stored backup records. This is where the unique label might be handy.

3) Memory backup with the option to include a unique label prior to writing the backup record into the memory backup file.

4) memory restore with the flexibility to pick any of the previously stored backup records. This is where the unique label might be handy.

5) A nice monitor window which translates those weird commands into human language. Plus a progress bar at the bottom and communication status area in the top right corner. The latter is illustrating CTS go / no go status when commands are pending in the transmit queue towards the Orion.

The donate button does not unlock features within the program nor will it start singing a song. It also does not provide a service & support contract. It is just there that in case you appreciate the program you can donate something to sponsor my hobby. Nothing more nothing less.

Thanks and best regards,
Onno

Onno you are a real HAM :-)

Tnx for all the good work.
Now where you have finished and has nothing to do :-) Would you be so kind
to make a version where you manually can change the settings in the AGC so
we dont have to get hour fingers demolized whith the many turns? :-)

Kind regards and tnx again

Topic: 7404 Message: 7408

Whats worse is that just after release my "final" version I discovered a selection bug... Fixed it and released the next "final" version V2100. O well... life is great.

Hmmm... AGC settings... yes there is already a program for that. Check the PA1AP AGC folder within file section. No turning knobs, just move the slider up and down... Also select correct firmware version (upper left corner) and you can set threshold and/or RF gain by just pushing the S buttons... Don't like to push S buttons? Just click on Auto S meter and the program will automatically scan and adjust AGC. It was an experiment and also fun to play with.

7409. Orion adjustment pots

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-15 21:26:04 UTC
From: Barry N1EU
Topic: 7409 Message: 7409

There are 3 adjustment pots accessible through the top and bottom front panel covers of the Orion. I'd appreciate help identifying them. There are two on the bottom - the one without external access is Contrast adjust and the one with external access is mic gain. Does anyone know what the one adjustment on the top panel (without external access) is for?

Thanks & 73,
Barry N1EU

QSL
I just did a re-adjustment using that potmeter a week ago.
Did not like the original S-meter behavior; sitting at S-1.5 at no input signal.

Using a Marconi signal generator I calibrated S1 at -121dBm(pre-amp off). Pretty accurate meter showing some +5 dB per S-unit.
Thus found S9 to be 7.8 really. But with pre-amp on exactly S9 again(-73dBm). Well'it's an S-meter, not science :)

Two issues however:
- Forgot if the RX ant for 2nd receiver was enabled yes/no, as this does affect the input for the main RX as well.
- 100W TX output now shows 85%, which is fine.

This mod did wonders for my display, resulting in a much better contrast.
I did not have to readjust the HW setting(potm), just the menu settings a bit.

Thanks for this modification. It is easy and very effective.

7419. Orion RCV settings

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-17 04:33:36 UTC
From: Paul DeWitte
Topic: 7419 Message: 7419

I am runnibg V2064X11, mostly chasing DX on the low bands.
Just wondering what others are using for RCV settings.

Do you use NR? I find that if I use NR I have to turn up the RF Gain quite a bit just to hear and then noise is back where I started.

Also what AGC setting. I find no difference in slow,fast, PROG, and off.
Maybe not trying one setting for long enough to tell a difference.

Any comments appreciated,and will the new V3 firmware be better?

Thanks, 73

Hi Paul
I can recommend you to read these files
http://groups.yahoo.com/group/orion565/files/pa1ap%20AGC%20program/ and
read all here http://tentecwiki.org/doku.php?id=565 This is a goldmine of
informations espaecially the AGC information are an eye opener. I have a
completely new ORION 565 after I have chnaged the AGC setting according to
W9GE´s list.

Have fun

Hi Paul, Per,

In essence the Orion Gain is in most circumstances to high which make the receiver sound "very busy". This because every tiny blib, crack, burb is amplified to nominal level.

Most practical (as shared by Barry and others) ;

1) go to empty part of the band
2) turn up AF volume to a level where you can hear the noise at a level you would like to hear the stations
3) turn down RF Gain until you hear the noise drop. Easiest trick is to look at your s meter indication (for example s3 band noise) and turn down RF Gain until the s meter exceeds the bandnoise (s4..s4)...

Don't touch anymore after that.... What will happen is that bandnoise will drop below threshold and will not receive AGC processing... That is a good thing since it will make a lot less sound.... However any station above the threshold (in theory your s meter indicator) would be processed to meet nominal audio presence...

As a result, desired signals will sound loud. and undesired signals would sound less.

The rule of thumb is that RF Gain should not be higher than 80% or so.

The AGC program was written to explore all of this behavior. Because I am lazy I also included the procedure above through push of a button principle but also learned that each firmware has different s-meter values within the software. That made it a bit challenging to keep up with all those firmware versions... Another thing included is a RF Gain / Threshold slider which is pritty easy to use since you can just slide RF Gain / threshold to any value by touch of the mouse pointer.

Anyway, enjoy experimenting with the receiver. It is great fun!

Best regards,
Onno

Its good to have a reference values and please keep in mind that AGC settings are station specific values.

From my point of view / experience;

Antenna's, antenna position, day and night time conditions, frequency, local noise generators (neighbor plasma TV's..) and so on vary for each station.

I am often using different values for each band and it is worthwhile (if hunting weak signals) to take a minute or so to adjust AGC to the band you are hunting.

Best regards, Onno

A few comments:

- I wouldn't bother with changing firmware versions at this point - just continue to use whatever is currently installed in your Orion and wait for v3 to be available soon

- Onno gave good advice previously. I would describe it as follows:

1. Go into Menu - RX and turn AGC Threshold down to 1uV or so - it's not critical and you just leave it there, ALWAYS. Other AGC settings are not critical.

2. Turn preamp on and RF Gain to 100. Tune in an s9+ station. Turn up the AF Gain till its very loud, but still comfortable. This is your AF Gain setting - NEVER change it

3. Now go to an empty part of the band. Leave preamp on (see http://tentecwiki.org/doku.php?id=565_566_588_rf_af_gain for an explanation why you always want to leave preamp on - you want to maximize the signal going to the ADC). Turn RF Gain down till you can just hear band noise faintly in the background. My RF Gain is typically 30-60, depending on band and antenna.

You're done. You can make slight adjustments to RF Gain as needed, but leave AF Gain alone.

And, for CW on all but the weakest stations:
- do what Barry says below, then
- set bandwidth to 100hz
- set NR to 2
- adjust RF gain so that it sounds like a code practice oscillator with absolutely no band noise.

CW is a huge pleasure when you do that. Great for ragchewing. I like my K3 but keep going back to the Orion just for this feature.

Work in progress. I shared this idea in earlier postings I think.

I have program flow made. starting with small window only containing one button called "learn"... adjust the orion to the settings you like and click the "learn" button. This will execute a query to orion and store it under a new button, followed by last question "button name"... Provide button name and ready....

The learn button will be recreated again and after changing bands and settings you can repeat the sequence again.... and so on....

When you start the program you will have a number of buttons. Click on any of those buttons (except learn) and the orion will be programmed according the settings as stored behind that button.

Sounds good?

Best regards, Onno

From: Barry N1EU
Topic: 7419 Message: 7429

Sounds very good Onno. If possible, I'd like the ability to store/restore without changing VFO frequency - store my radio settings other than the vfo frequencies and restore likewise.

For example, I create a stored profile for use in cw diversity reception that restores bandwidth/PBT, antenna selection, vfo selection, audio L/R, RF Gain (if possible), and AGC but leaves vfo frequency alone. If that's not possible, then I imagine I can just create a separate stored profile for each band.

Thanks & 73,
Barry N1EU

7430. Re: Orion RCV settings

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-17 15:59:59 UTC
From: pa1ap
Topic: 7419 Message: 7430

Right now the program actually creates a record for each button within a config_file. when pushing a button, all the program does is lookup the button record and read the elements.

I could create a preference bar and store this value to. The preference bar would allow the user to select which attributes will be send to orion after button is pushed. When you change the preference bar this value will be saved to the same config_file.

During the learn phase all attributes will be pushed into the record. During the execute phase (push created button) the preference bar enabled values will be send to orion.

I will share a screenshot later this week. The gui might be a bit challenging for me as novice programmer.

Regards, Onno

From: Larry Menzel
Topic: 7419 Message: 7431

Good morning, Paul.

IMO, the default AGC settings are not very dynamic, nor do they show off the receiver's marvelous abilities. In MENU | Receiver you can set different parameters for each AGC position. Here are the settings I use. Keep in mind that my hearing has deteriorated over the years and I like to see a fairly dynamic difference between AGC positions. So try these and see how you like them, and then you can tweak them from here. Begin by turning the RF gain to 100. Watch the S meter when adjusting the Threshold setting. Turn the RF gain back to about 70 when settings are completed.

Slow
Hang: 1 second
Decay: 10 dB/s
Threshold: 11 uV (About S6 on the meter)

Medium
Hang: .5 seconds
Decay: 20dB/s
Threshold: 5uV (about S5 on the meter)

Fast
Hang: .2 seconds
Decay: 80dB/s
Threshold: 1.4uV (about S2.5 on the meter)

Program
Hang: .1 second
Decay: 200dB/sec or faster to "taste" (about S2 on the meter)

I set the AGC Slope to 2:10 dB.

I use slow AGC when condx are good and on SSB and then work down as conditions get worse. Having the THRESHOLD available in the AGC settings makes it very convenient to quickly set the best performance for any conditions. You an still use the RF Gain to reduce more if desired.

There is no one "right" setting with Orion. But this adjustable AGC is one of the best features of the Orion receiver in my opinion.

With these greatly different threshold settings, I believe you'll appreciate this feature.

With thanks to Lee, WA3FIY.

OOps. I forgot the Threshold setting for the PROGRAM AGC setting:

Threshold: .75 - 1.0 uV (about S2 on the meter)

I use these same settings for both VFO's. You have to push the MENU button after each AGC setting is make, then push the AGC button on the front panel to the next level, and then go back to the MENU | RECEIVER to make the next adjustment...clunky, but there it is.

Don't forget to turn the RF Gain back to bout 70% or so after making these settings.

Thanks Larry I will try those settings. My hearing is also not what it used to be.

So will give it a try.

73, & Thanks

I will keep saying this until I'm blue in the face. What I am saying has
been confirmed by Ten-Tec Engineering.

Set the Threshold setting low (1uV), and leave it there. The threshold is
automatically changed and managed by the firmware when you lower the RF
Gain setting.

If you want to play with Threshold, fine. But don't. It was necessary
back in 2004 with early v1 firmware. But then AGC and RF Gain were
integrated in the later v1 versions and all that Threshold twiddling was
instantly obsolete.

Don't touch Threshold - use RF Gain.

The cult of magic AGC settings is alluring but won't help your Orion
performance. High AF Gain, low RF Gain is ALL you need to do.

Thank you for your input, Barry. I have used those settings for a long time, and was unaware of the "upgrades" of the automatic changes managed by the firmware.

I'll readjust one of my Orions and see how I like that.

Have a listen to what my Orion sounds like with the gain/AGC set as
I've described previously:

http://n1eu.com/mp3/ve3axw.mp3

I made this recording yesterday - VE3AXW on 40M LSB working some
weaker European stations. Please listen with headphones since it's a
stereo diversity recording. The left channel is the main rx and 40M
dipole; the right channel is the subrx with 580ft Beverage toward
Europe.

7438. Re: [orion565] Orion RCV settings

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-17 19:42:41 UTC
From: Barry N1EU
Topic: 7419 Message: 7438

One thing to notice on the recording - as Larry mentioned previously,
there's a wide dynamic range in the audio. Strong signals are louder
and weak signals are fainter. The goal is to minimize AGC action,
using it only to protect your ear drums on the strongest of signals.

If instead you opted to turn up RF Gain and turn down AF Gain, there
would be a narrow dynamic range in the audio with all signals being
similar loudness levels. AGC would be constantly working and you
would hear the band noise pumping up every time a stronger signal went
silent. Also, when there were several stations transmitting at once,
the audio would tend to blur together making it difficult to read
individual signals. That's exactly what you don't hear in the
recording.

Barry,

Do you have it set for 1uV in all the AGC settings? How do you go about setting your threshold at that level?

Larry

Yes

> How do you go about setting your threshold at that level?

Not sure I understand the question Larry. Just go into Menu - RX and scroll down to Threshold and set it. Like I said before, the Orion firmware will internally raise the Threshold value whenever you lower RF Gain from 100.

Hi all,

On my way back to Canada from Florida early January, I stopped in at TenTec and had a nice chat with John Henry. He explained to me the various changes in version 3. It sounds very impressive and I am looking forward to its release.

BTW I very seldom use the preamp on my Orion-II as I find that on very strong signals, even with the RF gain turned way down, the audio gets distorted at times. This is with no NR and/or NB switched in. I usually have my RF gain setting at around 60 and use more or less depending on band conditions. I've set the threshold so that it, with no antenna attached, hovers around S2 to S3 and I find this quite accommodating.

73, Tony VE3DWI/K8DWI

A few comments:

- I wouldn't bother with changing firmware versions at this point - just continue to use whatever is currently installed in your Orion and wait for v3 to be available soon

- Onno gave good advice previously. I would describe it as follows:

I believe this is due to gain distribution issues with the v2 firmware (it's not hardware IMD). Hopefully this distortion won't occur with v3 firmware.

Larry,
What do you set your Threshold to for PROGammable?
And do you use the same settings on the sub receiver or something different?

Hi George,
Not yet, the beta testers are still giving it a wringing out. It has a lot of improvements and it is well worth the wait!! I love the work that has been done!!

Hi, Rolf,

Well, I've always set my Threshold in PROG for .75 to 1uV. My question to Barry was how to set threshold in the other AGC modes.

Larry, W0PR

Oh, now I understand the question. Simply select the other AGC mode
before going into the Menu-RX

You can only modify the settings of the AGC mode that is in play prior
to bringing up the Menu.

Of course you do, but, what I'm asking is if you set the threshold in SLOW, MED, and FAST all for 1uV?

Larry

7454. OT: backup and restore

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-19 16:10:50 UTC
From: pa1ap
Topic: 7454 Message: 7454

Prior installation pleae uninstall previous version.

Fixed a couple of issues;

1) after a backup config the program now recovers main and sub AGC mode. It did not do that in previous versions

2) after backup memory the program now recovers pre frequency and mode for sub receiver. It did not do that in previous versions

3) there is a new selector which rotates between translate, request, response and req - res mode... This allows you to see communication taking place between program and orion...

I verified the program and it does do the job correctly. Got feedback from two users they were unable to get it to work.. I don't know why...

The commands send to orion always obey CTS and include scheduled departure through a queue mechanism. This way the orion is not bombarded with commands in one big burst. Learned that orion 565 does not like frequency to be changed (vfo A) while performing serial communication... something to consider while performing backup.

Program checks on; CTS, time interval, error conditions including K etc.

Hope this helps. In case you find issues let me know.

regards, Onno

Onno -

BR V2120 works great. It installs fine *IF* any other VB6 applications
are not running. The progress bar shows only 88% when the program
completes a backup.

I assume you can't back up H/W MIC Gain since there is not a serial
command for it.

From: jevacuum
Topic: 7456 Message: 7456

I have too much audio out on RX even with Line Out selected to Low and computer (Wave In) set to min.

Do not have enough audio out on TX even with Aux Input Gain set to 100.

This is using EasyPal software but also have the same problem with HRD + DM 780.

Have been using the internal soundcard of the computer with homemade cables with isolation xfmrs and a 3 db resistor dropping pad in the RX cable with sat. results.

The computer is a Dell 8300 using Windows XP.

Any ideas? Eric K9NP

Will fix the progressbar in next release. I know what causes it. Thanks for feedback and good to know about the installation condition. Thanks and regards, Onno

Eric I am using EasyPal and HRD 5.0/DM780 & PC-ALE with no problem. But I am running directly to/from the soundcard into the transceiver. I have tried my Dell Inspiron and with the same result.

Try to remove the soundcard driver and restart the computer and let it reinstall the driver itself. With XP it often works :-)
If you can try to install Win 7, the computer is much faster and runs more stable in DM780

Knd rgds

Per OZ1EQC/OV2V

From: John
Topic: 7459 Message: 7459

Hi Everyone,

Just to give you an update. We did make a software improvement this week that I want to ensure gets fully tested. I want to work it through it's paces on the contest this weekend. And judge on Monday AM whether the V3 firmware is ready for prime time or not.
Note: We won't ship any RX366's until we know the firmware is solid.

Best Regards,
John Henry

Solved the too much audio on RX by changing the AGC slope from flat to 2:10 dB. Not enough audio out on TX remains. Eric K9NP

Progress bar fixed and also including "translate+" which makes it very easy to understand which menu, button or knob has been included within the backup... It also allows you to copy and paste into a word document and print the settings to keep as reference... The idea is to be able to look at the document and "recover" a value through the hint as provided by translate+... This on request of a contester.

Regards, Onno

Hi John,

There are some dependencies we discovered over the last couple of days which I am including / updating in the program. Ben has been of great help providing suggestions. It has to do with the sequence of (pseudo) associated commands where the backup sequence is opposite to the restore sequence. For example and to be confirmed; recovering notch center frequency requires notch to be enabled first through command line. Right now there might be a couple of commands where I missed such sequence...

Most important (and embaricing) is that I used to the wrong command (KRB instead of KWB) to restore the memory. Its already fixed for the next release but still... I should have seen this before and I simply missed it.

Best regards, Onno

7465. OT: Backup & restore V2310

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-20 09:41:21 UTC
From: pa1ap
Topic: 7465 Message: 7465

Hello,

PRIOR to installation;

1) uninstall the previous BR application
2) ensure no other VB programs are running (close other rig control stuff)
3) remove the Orion_backup_config v2.txt and Orion_backup_memory v2.txt files within your "my documents" folder... the format changed a little and I want to avoid issues
4) install the V2310 application

//////////////

I included the option for "a hint" for the config backup / restore window. Below an example of the output;

The hint is between brackets. You can enable it by selecting "translate+" within the BR program.

The idea is that the hint provides where you would normally find this value when using hand / eye coordination ;-)

[Main RX > AGC]
Main AGC mode Fast
[Sub RX > AGC]
Sub AGC mode Fast
[Main VFO dial]
VFO A 14250000
[Sub VFO dial]
VFO B 14035000
[Main ant matrix]
Ant1: Both Ant2: Not Rxant: Not
[TUNE]
TX Tuner Off
[Main Audio]
Binaural Receive Control Off

Furthermore the memory restore function has been fixed. Sorry about the mistake made.

There is a known challenge with the event window when performing memory restore. It does not include a reference to you which memory location is being restored during the process. I will fix that later.

regards, Onno

Hi John.

Anything new brewing for firmware upgrade for the 566?

Thanks, and 73

Andrew K6STN

Hi Andrew,

Yes, more reliability, several enhancements, new features, one will help you copy signals that you couldn't discern on previous builds or other rigs to date. Coming soon, very soon. Days away now, not weeks.

John

Onno -

The latest Backup and Restore works great. Backing up the memories made me think... Now if I just had a utility to set the four memories for each band. Something like the computer utility used to set memories in a VHF hand held.

Thanks for your great support of the Orion.

I'm extremely happy that someone is making a utility such as this for the Orion.

However, Onno is also severely handicapped in trying to make a complete backup/restore, handle 100% of the rig parameters. What I mean by this is the following. There are a lot of adjustable parameters in the Orion 565 and Orion II 566, and not all of those items are available via the CAT interface. I did make the 588 expose 100% of the rig controls adjustable, and more, via the CAT interface, but the Orion(s) are of an earlier era where what was put into CAT control was what was needed to change routinely, not the nuts/bolts underlying some things.

Anyway, This is meant as a THANK YOU to Onno, and also a caveat to others, he doesn't have all of the interfaces available to him for all of the data items. Maybe someday, but not today.

Thanks,
John Henry

Right after accepting the EULA's, the setup program claims I will need 1,620 MB (approx. 1.6GB) of disk space to install. Seems large to me -- is this expected? Unfortunately my poor shack PC has only 800MB free on the system drive (C:\) but well over 8BG free on a second drive (F:\). Is there any way to direct it to put all files, even temporary files needed for installation, onto that second drive?

Thanks in advance,
Barrett / KE4R

No thats sounds very wrong.... The EULA are microsoft module confirmation and it will download some VB modules from microsoft but they are around 30-40Mbyte in total. The program itself is less than 1 Mbyte.

This is weird. Let me double check and come back to you. Best regards, Onno

The required .net framwork 4 client profile claims about 182Mbyte on one of my Vista computers. For XP I could choose a different version which claims around 65Mbyte. For windows 7 the MS documentation claims this .net stuff is already included and hence the only change is my reasonable small program element (1 Mbyte)...

I am sorry about the required installation environment through microsoft. I will investigate if I can make it smaller but also want to ensure the program can run on all those different OS's around the world.

Best regards, Onno

Sorry could not resist to provoce :-) :-) :-) :-)

I actually had to buy and install windows to get this darn program done.... there seems to be a large(r) audience using windows within this group. You know what? Let me post a vote and see what the distribution is. Would be good to know and if development needs to be done on Linux I would be more than happy to do so. Smaller packages, easier interface etc... best regards onno

7483. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-21 10:35:21 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 7483

Enter your vote today! A new poll has been created for the
orion565 group:

The computer operating system I am using to run my Orin rig control software is....

o windows nt
o windows xp
o windows vista
o windows 7
o windows 8
o linux
o other

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13120192

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Wow,

it is a known fact that Linux runs on ~1% of all desktop machines. The other 1% is MacOS and other Unix-like rare birds. The world's biggest virus is nested on ~98% machines. Therefore a poll is meaningless...

Instead of provocation, I would prefer a true multi-platform (and Open Source, what else?) application. But stay cold Onno, for me is any third-party application less important because I operate CW only and prefer AGC off. Also I am not lazy to use front panel knobs (> 250 000 Q's made in this way). NB/NR is unefficient with BW of ~200 Hz... not too many things to adjust.

My reply was meant as a support to Peter's OZ1PIF request, I was also a bit curious how do you adjust the parameters (aka sniffing into source code :-). So that's, Onno. Consider my thoughts as very unimportant.

Maybe you should look into Python, Onno, that's what Joe Taylor uses for
WSJT and WSPR (plus some fortran and c routines for math intensive and
performance critical stuff) - it's available on all current platforms:
Windoze's, UNIX'es, Linux'es and Mac's.

Linux has been my main system since 1980. I much prefer it
to Windows. I only use windows on my laptop in the ham shack
since so much software for ham radio is Windows, but
Linux meets my needs for everything else much better.
All my other machines are linux.

From you comment, it sounds like you usually use linux --
if so, you may prefer to use wxwidgets for the gui
and either mingw or cygwin for c and c++ programming.
I believe that's what fldigi does (and I think S-meterlite
is going to wxwidgets as well -- btw S-meterlite now
is compatible with the Orion).

I wrote a c program under cygwin to restore my Orion
to all my favorite settings after a master reset way
back when I first got my Orion. That program is the same
code for both linux and windows. I didn't use a gui
because all I wanted was to restore the Orion to my favorite
state, so I didn't need to change anything in what
the program does with each run, but if I wanted a gui
I'd use wxwidgets which provides the gui interface for
all windows os's as well as linux. Look at fldigi -- it's
a good example. If you use mingw or cygwin and wxdidgets,
all you need to do for windows is include either a mingw dll
or cygwin dll depending on which you are using, and include
a wxwidgets dll to get you installation to work on any windows os.
On linux, all that's needed is for the user to have installed
the wxwidgets package which seems to be the default for
a number of distributions these days.

Then you have a single c/c++ app for all those platforms.

Look at fldigi to see what you can do with wxwidgets
and mingw.

7490. ORION AUTO BAND CHANGE CONTROL CABLE FOR TOKYO-HYPOWER AMPS

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-21 20:22:26 UTC
From: Lee
Topic: 7490 Message: 7490

If anyone is interested in a auto band change control cable for Orion to Tokyo Hy-Power amps please contact Dave KD1NA at darjar@.... He built one for my Orion II that does auto band control on my Tokyo-Hy Power HL-2.5 Kfx perfectly. The auto band control cable is NOT the same cable for the THP 1.5 and 2.5. Dave can build either one. I contacted Ten Tec and Tokyo-HyPower and had no luck and Dave was kind enough to build one for THP 2.5. Dave used to own a THP 1.5. Dave does fast, neat, professional work. This is not an ad to sell cables, but simply to let Orion owners that have Tokyo-HyPower amps that there is a auto band control cable available. Considering the dollars invested in the Orion II and the THP 2.5 I was a very happy camper to be able to pay Dave a modest sum for the auto band control cable. If you want to spend at least eight hours time and like to order parts and do lots of soldering, free plans for this control cable are available. I would rather spend the time on the air than soldering. 73, Lee W7RP 970-234-8989 leearmitage1@...

7491. [orion566] ORION ALC AFC

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-22 08:05:15 UTC
From: Jacques Paoli
Topic: 7490 Message: 7491

I wonder if anyone has a solution to address ALC and AFC ORION II 566.
What would be the method?
thank you

7492. Orion 565 no output

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-22 20:15:22 UTC
From: Paul DeWitte
Topic: 7492 Message: 7492

This morning I was using ant 2 to chase some DX. It is on a 30m vert, so I had the power turned up to about 98.

After I quit on 30m I went to I think 10m. I am using a Herc II on all bands but the 30m band.

I use ant 1 on all but 30m. I forgot to turn down the power when switching bands, and TX into the Herc with power set at 98. I thought that I had blew up the Herc as it did not work after that.

After playing around, I found that the Herc is OK but the Orion does not have any output on any band.

So far I have tried it into a dummy load, did a master reset, turned it off and back on, all with no results. Looking for suggestions.

It does RCV OK, just does not TX.

Thanks,73 Paul

7493. Re: Orion 565 no output

From: pa1ap
Topic: 7492 Message: 7493

That does not sound very good. Perhaps you could try the following;

1) in case you have tuner installed, enable it and push TUNE... followed by disabling it. I noticed that my tuner sometimes goes in funny mode and little to no power goes out of the orion.

2) master reset should put everything back again. If you connect you dummy load to ANT 2 and switch TX to ant 2.. do you measure power?

3) when PTT is pushed, do you see increased current on power supply?

4) when switching to CW and keying the rig, do you hear the QSK clicks?

5) when keying the rig with CW mode, do you see the SWR indication on the lCD showing up?

6) go to menu > TX > disable the transmitter and enable the transmitter.. Leave menu and check if PWR is anything higher than 1... If it indicated off, your transmitter is disabled. Check VFO matrix as well and see if TX button is enabled (yellow led) and assigned to VFO...

Let us know what you find.

Best regards, Onno

I have no confirmation but just remembered I have been reading the end stage is also (over) temparature protected. I can imagine that it would take time to recover from this protection... Perhaps the unit works again after it got a cool down period...

Also try turning the keying loop OFF if it is turned ON and see if that has
an effect on the zero output.

Paul,

Make sure the PWR button at upper left side of the screen has not been toggled to OFF. You must push this button and hold it for a few seconds to toggle from OFF to ON.

Hope your problem is this simple!
73 Bert W5ZR

On Jan 22, 2012, Paul DeWitte <k9ot@...> wrote:

This morning I was using ant 2 to chase some DX. It is on a 30m vert, so I had the power turned up to about 98.

After I quit on 30m I went to I think 10m. I am using a Herc II on all bands but the 30m band.

I use ant 1 on all but 30m. I forgot to turn down the power when switching bands, and TX into the Herc with power set at 98. I thought that I had blew up the Herc as it did not work after that.

After playing around, I found that the Herc is OK but the Orion does not have any output on any band.

So far I have tried it into a dummy load, did a master reset, turned it off and back on, all with no results. Looking for suggestions.

It does RCV OK, just does not TX.

Thanks,73 Paul

Hi John,

This announcement is making me curious, of exactly what changes are in store. What are the enhancements and new features? I have an Orion 565 and am wondering how the improvements will affect the rig? What new features will there be and how are the specifications improved?

I am eagerly awaiting the new v3 and RX 366 combo. Keep up the good work.

73,

Thanks for all of the ideas and help.

I have tried with the keying loop off and several other things all with the same result.

I put it into a MFJ tuner with a dummy load and meter. It shows about 1 or 2 watts out.

I got a reply last night that this had happened to him and it was the drivers to the finals on his rig. He put in new ones and that fixed the problem.

So a call to T T is in order.

Thanks guys, but I did get the VP6 on 160m this AM with the trusty old Omni VI+

Hi Mike,

The changes to the firmware for the 565 (as paraphrased quite nicely by one of the beta testers, with a few tweaks of my own) include:
- Added support for RX366 subreceiver option
- Added SAF feature to NOTCH button and DSP; audio peaking with
variable width and center frequency (so far, EXTREMELY good reviews by the testers)
- Tweaked sweep operation (a tad more update, and functionality)
- Modified SIDETONE level to make the gain range more usable (trying to cover a larger range, but still not overload at varying conditions, a hard line to balance on)
- Increased audio line out levels (means better performance with varying sound cards)
- Minor changes to Speech Processor for smoother operation
- Adding push hold function to A>B to transfer settings from main to subrx (transfers a few more items than before)
- Smoother audio switching with QSK cw
- Added BW, PBT, AGC, Mode Tracking option between Main and Sub Receivers (aids in contesting, dx, and diversity operations, fewer button presses to keep the parts of the main and sub you like locked together)
- Added Global or Per Band option for MIC and PWR
- Added/Fixed serial commands for sub-receiver ATTN and PREAMP
There are a few other items added, will include in the official V3 intro doc. (still working on it)

This is just a bit of what has changed. The other part that has happened in all of this is making the rig even more reliable and mature. Had the beta test team identify what they thought were the most nagging annoyances and worked on those as well. So, better performance from both a reliability standpoint and from a operational receiver quality standpoint.

A new level in receiver performance and features for the Orion(s). As TenTec is committed to doing.

Hope this helps,
John

As part of the beta team I would like to express my appreciation to the Ten Tec development group. Since the start of the development cycle they have been very responsive to beta testers observations, findings and suggestions and usually providing a solution within days if not hours. It will be exciting to see the new release become public and how you all will enjoy using it. I think it is amazing piece of software development with equally amazing investment as made by Ten Tec to extend the lifecycle of the Orion by at least another decade. Very impressive combination! Thank you Ten Tec! Regards Onno de pa1ap

I'd like to echo Onno's comments. The commitment demonstrated by Ten-Tec for continued support of the Orion will prove to be a big long term win-win for both Ten-Tec and their Orion customers. My thanks go out to Jack, John, and Gary. Special appreciation to John for his "can do" attitude and dedication to keeping everyone informed.

I think it's preferable that they match but stereo diversity will still work well with unmatched roofing filters since the dsp selectivity will match. I definitely prefer to have the audio passbands match as closely as possible ear-to-ear.

Glad to see that you have been participating Onno :-)
I have only one complaint on my ORION and that is the build in keyer :-)
Cant use the Iambic modes, I am trained with the Danish commercial keyer
Squeeze Key MSK5. Would be nice if one could make the settings our self.
Iambic is alternating dits and dahs when you press both paddles same time.
If one could choose no alternating and choose between dot and/or dash
memmory. One could program it to alle the different keystyles on the market
:-) But what the h... I have the best radio, and next to it the best keyer
:-) = the best OP :-)

Hi all,

This is the very reason that, when I retired in 2007, I decided to purchase the ORION-II. With a radio that can be upgraded, functions changed, improved upon when needed and all that with a download to your computer I don't need to purchase another one for years to come. I am really looking forward to the new release.

Tony VE3DWI / K8DWI ex PA0MIH.

I'd like to echo Onno's comments. The commitment demonstrated by Ten-Tec
for continued support of the Orion will prove to be a big long term win-win
for both Ten-Tec and their Orion customers. My thanks go out to Jack,
John, and Gary. Special appreciation to John for his "can do" attitude and
dedication to keeping everyone informed.

Hello John,

Thanks for the information, this sounds great, sounds like a new radio!! I am eagerly awaiting the availability of the new software, and the RX-366. Thanks to all involved in making this upgrade possible. From the info gleaned here from a couple of Beta Testers, on this group, it sounds like a dramatic improvement in the Orion. I am curious, does the software re design bring about any improvement in measured Dynamic Range, Noise floor or other specifications of the receiver?, or are these solely determined by the hardware? I would be interested to know the difference in the specs between the new sub receiver(RX-366) and the existing Main RX in the Orion.

Thanks again and keep up the good work!!

73,

Mike KA0KLQ

Perhaps John will reply, but my educated guess is that the RX366 dynamic range improvement is approx 20dB over the original subreceiver. The most noticeable improvements will be:

1. ability to copy weak signals when there are nearby strong signals
2. immunity to rx overload when there are very strong signals anywhere on the band

The limitations of the stock subreceiver in these two areas should be apparent to anyone who operates in tough conditions (on all bands, but especially on 160M).

Essentially the subreceiver performance will now be equal to the main receiver.

After having the Orion II for a few months I have concluded it is the best radio I have ever owned. These improvements will make the best better!

Okay, I know, I'm probably putting my neck on the block here but I's just gotsta ask!

When?

Yeah yeah I know it's a little word but it can mean sooooo much.

Thought I read something that indicated now is the time to be checking up on stuff like this but not seeing the usual rash of questions so I assume there is either a moratorium on asking, in which case profound apologies, or it's years away still.

Cheers

Hi,

Yeah, already did that but just got the same vague sort of response. Well I guess that's it, at least for now. Within a month hmm, this one's pretty much done so I guess that'll be the next one then.

Good enough.
Can I say I'm excited? Does it show?

Cheers

Barry,

This is about what I was figuring, as the existing sub RX is of similar architecture as the Jupiter, about 70-75 dB DR at close spacing. I am curious as to if the software will bring any bump up to the performance numbers. I am pleased with the 565, especially since the most recent 2.064 software came out last year. I have had it since 2003, when it was the first rig of this architecture, in a number of years, with other improvements. Early on the rig had issues with reliability, but those seem to be long gone. Some miss the cleaner noise reduction performance in the V1 software, but since I have found the trick of running the RF Gain at around 70 the noise is much lower on the lower bands, (this has been talked about much on the various Ten-Tec groups), and it is no longer an issue for me.

Since 2003, the competition has stiffened up, and there are now a number of rigs with similar performance numbers, the K3, Flex 5000, and the FT-5000 series. I hasten to add that the Orion II was introduced with improved performance, but before these rigs were introduced. On balance, I think that the Orion/Orion II still holds its own, with some of the ones above better in one way or another, but overall on balance the Orion is still a winner. Hopefully this new upgrade raises the bar and keeps the Orion solidly in the game.

73,

Mike KA0KLQ

From: billw5ao
Topic: 7518 Message: 7518

I have posted a few performance videos showing Orion II functions under different circumstances for your viewing pleasure.

http://www.youtube.com/user/3cx800

7519. Re: [orion565] Re: RX366 and V3 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-27 14:06:50 UTC
From: Sam W Jacobs CET
Topic: 7459 Message: 7519

I take it V3 will be for the ORION II, not the Orion I ?
Also, is it possible to take the TX Filter BW higher than 3900 Hz (current limit) ??
When we are running eSSB late at night, I hear the Flex Radios running at 6 KHz and they come close to FM in sound.
The Kenwood's can also be increased.

I can't see why the ORION II's can't be programmed to do the same.

Thanks,
Sam

(also requested more control over screen colors and schemes)

After having the Orion II for a few months I have concluded it is the best radio I have ever owned. These improvements will make the best better!

> Thanks for the information, this sounds great, sounds like a new radio!! I am eagerly awaiting the availability of the new software, and the RX-366. Thanks to all involved in making this upgrade possible. From the info gleaned here from a couple of Beta Testers, on this group, it sounds like a dramatic improvement in the Orion. I am curious, does the software re design bring about any improvement in measured Dynamic Range, Noise floor or other specifications of the receiver?, or are these solely determined by the hardware? I would be interested to know the difference in the specs between the new sub receiver(RX-366) and the existing Main RX in the Orion.

v3 versions for both the Orion and Orion II should be released simultaneously. I suspect that there will be more alignment of firmware development on the two rigs going forward

I've heard of no plans to increase the ssb tx bandwidth. If I recall correctly, the max tx bandwidth actually measured about 3.3Khz last time I measured it.

Personally, I'd rather see the ability to increase the AM tx bandwidth - AM tx audio is currently fixed at 3Khz bandwidth. While we're pipe dreaming, why not increase the max AM rx (and tx) bandwidth to 15Khz to match that nice wide RX366 15Khz roofing filter?

7521. RX366, v3 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-29 18:01:30 UTC
From: Barry N1EU
Topic: 7521 Message: 7521

I suspect the v3 firmware will available in a matter of days and the RX366 may start shipping in the same time frame

I've posted a new Web page sharing some thoughts and sound clips on the RX366 and the new "Selective Audio Filtering" feature in the upcoming v3 firmware:

http://n1eu.com/orion/orion_v3.htm

Adding the three filters with shipping makes it over $1000.
About twice what I wished.

Good to know the expected ship date k.denief, thanks. And I think the price you noted is very reasonable. The KRX3 2nd receiver card for an ELECRAFT K3 by the way, is actually a bit more.

When making a decision as whether to go ahead with an enhancement or upgrade to your existing station, comes down to need and value.

If you are a contester or DXer, the RX366 will be a welcome addition. Having two matched, high performance receivers is a significant plus when it comes to operating both in a messy (i.e., crowded) band and one populated with weak signals, where diversity reception makes the difference between hearing the other station and making the QSO.

Another misconception. You do *not* need additional filters to effectively use the RX366. The DSP code is extremely good.

Regardless of whether or not you purchase the RX366, you owe it to yourself to install the new version 3 firmware when it released. You will be impressed by the scope of the enhancements, modifications, and fixes that were made, all in response to requests from the existing and potential user communities.

From my perspective as a Ten Tec (and Elecraft and Yaesu) user and a volunteer beta tester for a long time, both the version 3 firmware and the RX366 high performance receiver mark the re-introduction of the the Orion 565 and Orion 566 to the ham radio marketplace.

Help me. So the filters, like 1.8, that are already on the radio, work on just the main receiver?

I agree with everything Eric said, except I'd recommend a narrow cw filter
for serious cw contesters and dx'ers. It will significantly improve
close-in (<2Khz) IMD performance.

I think that's a fair price in any case. Just the other week I was mentioning it to a friend, I said $500, he said $1000, seems we were both wrong, or right. Now how about a new processor board with several GB of memory and enough power to really show off the RF capabilities. Yeah I know I dream.

Will be interesting to see the reviews in due course

7533. New Products.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-31 18:32:55 UTC
From: John
Topic: 7533 Message: 7533

Back at the 12th annual Hamfest, TenTec announced several new products that we would have in production, for sale, late 2011 and early 2012.

Today, I am pleased to announce that we have met our goals on the following:

Model RX366 High Performance ASR Sub-Receiver for the Orion Model 565 and Orion II Model 566. This is a new contest grade second receiver for the 565 and 566 Orion series of transceivers. This new second receiver uses ASR (Advanced Signal Reception) technology like what is already a proven winner in the Eagle to provide a great enhancement to the rig. The RX366, requires the new V3 Orion 565 and Orion II 566 firmware. With V3 installed and the RX366 installed, the Orion(s) now have vastly superior performance to the original sub-receiver in terms of immunity to interference from adjacent strong signals and immunity to overloading from very strong signals present on the band. Your Orion 565 and Orion II 566 have never worked so well before.
Price = $639.00
(1 2.4kHz filter included)

Model 717 - Microphone Equalizer / Audio Interface. The 717 will allow you to connect new dynamic microphones, such as the Regal Model 707 Desk Microphone to older rigs that required a higher microphone input level such as from an electric mic element.
The unit works with Icom, Yaesu, Kenwood as well as older Ten-Tec transceivers using 4 or 8 pin circular microphone connectors. Now you can use the rally cool Regal Model 707 Microphone with an older Ten-Tec rig such as an OMNI-VII. You can tweak the actions of hi and low frequencies to meet your needs.
Price = $119.00

Model 318 Amplifier Key Interface. The 318 will allow you to dial in a delay when you connect older linear amplifiers to your transceiver. This will be useful if the amplifier is not designed for full break-in. An excellent seamless add-on for Eagle users who want to adjust the transmitted output to work with older amplifiers. Adaptable to almost any transceiver.
Price = $89.00

Note: V3 firmware for the 565 and 566 is in the process of getting bundled up and placed on the internet. Estimate for V3 release and posting is by 5pm EST Tuesday.

Best Regards,
John Henry
TenTec Inc.

Correction, In the Model 717 description, I meant to refer to the older transceiver, OMNI-VI, NOT the OMNI-VII. The OMNI-VII is far from old.

7536. Orion 565 V3.025 is uploaded

Yahoo group: orion565 (2009 — 2013)
Date: 2012-01-31 21:37:14 UTC
From: John
Topic: 7536 Message: 7536

Look for it on
www.tentec.com
hover over Downloads,
click on Transceiver Downloads
scroll down to the 565 section.

565-setup is on the right hand side.

Enjoy
Working on the 566 installer now, may not make it tonight, worst case it will be up Wednesday Morning.

I was just reading the info on updating the firmware in preparation for the V3 update for the Orion II. All instructions seem to assume that everyone has done an update previously and talks about running the Update Program. I don't see this program available at the Tentec site for download - is it included in the firmware .exe file?

Barry-

What is your impression of the RX366 as an SWL receiver. I assume it is just as good for ham use as the Orion main receiver, but I'd appreciate your comments. It is a little pricey but a cheap way for me to upgrade. I think you are still using an Orion "I" as I am. I haven't looked at the Orion diagram in a long time, but at first guess I wonder a little about the filter setup? I more or less assume you don't need to duplicate any of the filters, but can you confirm this?

Bob, before I did that 30 second test, I had never listened to SW on the RX366. I would suggest you pose the question to the Eagle forum on Yahoo groups.

I don't understand the question about needing to duplicate any filters ??? The two receivers are completely independent and having filters in one doesn't obviate the need to have filters in the other.

If you meant this to be private communication, please email me back directly.

7546. RX366

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 00:33:19 UTC
From: Marty Young
Topic: 7546 Message: 7546

In preparation for my order next week of a new Orion 2 I asked about shipping the unit with the new RX366 preinstalled, if there was a difference in price. (hoping maybe it would be the new standard 2nd RX. No dice) Per Stuart, they will knock off $150 from the $639 price if you order this option from the get go. So new, the O2 ordered with the RX366 is $4295.00 + $489.00 + whatever else you want. Its something.

Marty / W4MY

Downloaded and installed V3 firmware on my 565 Orion. Easy as pie.

Windows XP Pro w/Svc Pk 3 riding on Parallels 4 with OSX 10.6.8

Old Radio Shack USB to Serial to standard serial cable and original driver.

SAF on AM - WOW Nice!

Anyway, for those of you running Mac's, at least with XP it installed without a hitch. Did I say WOW? Will need to flog it more of course but WOW. Off to CW I go now. Tnx John

Gene / K7TXO

Will have to

Interesting comment Gene - I also discovered that SAF works great on weaker AM signals.

Congrats & thanks, T-T!

Downloaded and installed V3 firmware on my 565 Orion using Windows 7.
Very easy. Tried to work very hardly readable HK0NA. After SAF it was
easy to read and finished my QSO within 5 minutes.

How I missed a Linux installer!

I operate almost only CW.

Sorry about that John!
Here is a COPY of the remark.

>>>>> Hi Ron ... At one time or another I have had the OmniVII, the OrionI and I now own an OrionII. Having had an opportunity to try all three, I have an opinion but it will probably be different than many other hams that will write you but here's what I found. The OmniVII is OK but I was not impressed with the receive audio and since that's what I get from the radio, I did not keep it very long. It's pretty though! Next, I got a great deal on an OrionI and that is a real radio. It was probably the best radio that I have ever had. I could find little fault with it except the display was not impressive. I contacted TT and ask about the blue/silver display that they have on the Jupiter and surprisingly it IS available for the OrionI and the cost is only $150 plus installation labor. That would have made a huge difference! About a month ago I ordered an OrionII and it really has it all, including a big price. I do not see much difference in the operation of the I and II except the display and TT was very honest at telling me what I would find. The OrionII will never leave my shack! BUT if I had it to do all over again I would find a nice, well adorned, OrionI and have that new display put on and with the money left over, I would take a nice vacation! I am seeing a lot of OrionI's and they are a bargain!

Milverton:

Thanks. I owned an Orion I about 7 years ago or so. The firmware at the time was buggy and the display sweep wasn't the best to say the least. But with the new receiver option, firmware and the ability to add an external Panadapter, I'm looking for a used Orion I, as it appears the receiver and transmitter circuits are near the same.

7555. V3 update not successful yet

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 05:02:16 UTC
From: art davis
Topic: 7555 Message: 7555

After loading the new version 3.025 firmware into my 565, doing a master reset and clearing the memories, the radio lights up as it should but stops one step short of going operational. The screen displays the normal TT logo, Version number, date, time, DSP version and goes no further. I have repeated the process with same results. I am upgrading from 2.064x11.

I do not have the RX=366 installed and therefore I select "NO" when asked.

I am going to start all over and download the file again and try again. Any other suggestions?

Tnx, Art N4UC

Greetings,
The RX366 does not have the ability to receive the standard USA AM band stations. SO for those of us that like to listen to our local AM broadcast band stations,it is time to buy the CCRANE-2 AM/FM goodtime radio.
Enjoy both receivers,
Kirby,K7EC

Subject: Re: [orion565] Is the RX366 Ham band only ?

Bob, before I did that 30 second test, I had never listened to SW on the RX366. I would suggest you pose the question to the Eagle forum on Yahoo groups.

I don't understand the question about needing to duplicate any filters ??? The two receivers are completely independent and having filters in one doesn't obviate the need to have filters in the other.

If you meant this to be private communication, please email me back directly.

Are you using a USB serial port adapter? I've heard that some of them can
be problematic.

Recently I had simillar experience and in my case the cpu battery became bad. It kept on looping after power on, showed all the boot messages and even allowed me to answer yes to the questions raised. But then it looped to the start again.

Your case might be different but that was my experience. replacing the battery fixed it for me and it seems there lifetime is about 6 years.

Can you confirm if you can load a different firmware version which will make the orion operational? If none of the firmware versions will make orion operational it sound logical the battery is flat...

Best regards, onno

It's not up yet for the 566, only the 565.
The "words" are there, but no underline. That should change in an hour or so if John is on time with his predictions (the underline will tell you the link is in place).

From: w2msj
Topic: 7564 Message: 7564

When I first turn on the ORION II, there is a popping sound in the speaker, the screen flickers and the S meter jumps around. Is this the problem caused by the A9 board filter caps or ???. At first (month ago) there were only a pop or 2 but the symptom seems to be getting worse. This morning it probably lasted about 15 seconds and then stopped. Once stopped it usually does not re-occur until the next time it is turned on. Suggestions?

Hello to all.

I suspect that there will be plenty of the "old" sub-receivers gathering

dust. A shame that it can't be reused or can it ?

Sure would be nice to have some hardware/parts and a cabinet

to make them into a stand alone general coverage receiver that is.

No, but the sweep won't function unless you do the v2 mod. But the rig should work fine in every other way.

That's my understanding anyway.

From what I gather the 366 is "ham only" receive, so I won't be swapping mine out, but if they ever make one that is as good as the 366 that is general coverage, I'll think about it.

I see the revised manual for the 566 is posted now, so perhaps it's just a matter of minutes before the software is there too.

This confusion is propagated by TenTec's mistake on their Website. The specifications tab for this RX states "Ham Band RX 160-10 mtr". I saw this myself an hour ago.

It's very possible that the RX366 is OPTIMIZED for ham band reception and
in so doing, gives up some performance outside the ham bands and Ten-Tec
intentionally specified it that way.

I suspect Barry is correct. The specifications for the receiver are for the ham bands 10-160. Sensitivity in general coverage will likely be just fine, as traditional short wave frequencies are typically still within the .5-30 Mhz range just like our bands which the radio already manages quite nicely.

Barry, you might comment on what you hear on short wave and if you feel the performance is in any way diminished, which I would doubt, at least for what most SW listeners hear.

I ordered my 366 last night and it was shipped this morning. Yea!

Larry, W0PR

PS Installed 3.025 on my Orion (1) this morning, and played with the SAF function...pretty damn neat! Installed with no glitches, too.

It would be nice if TT would offer a "trade in" discount. If I'm taking out my old VFOB and installing the 366, they could reuse our old receivers in their refub units. That could bring the cost of the 366 down to, perhaps $10... HA! Well, at least $200 or so.

While I'm at it, I still want more control over screen colors. It's backup battery has a clock function built in, it would be nice to see the time on the radio display. My NR makes everyone sound "underwater", I hope they have this fixed. While I have the soapbox, my only complaint about the 566 when I first purchased it was the "cheap" knobs and controls. Grab a hold of an ICOM or YAESU (or even Kraco CB) and the knobs have a "solid" feel to them and the controls are smooth (MilSpec). These controls on my 566 are flimsy and the knobs are cheap plastic. For close to $5000 you would think TT could invest in better quality controls and knobs.

OK, I'm done for right now however love the radio and awaiting the software mod. This will be the first upgrade I will be using since 2.039d as all the other ones f*** up the audio when the AN is engaged. I like nice clean audio... no pops and clicks like the newer versions have problems with.

73,
Sam

The word is that it's simply a matter of no bandpass filters being used outside of the ham bands in the RX366 so you might be susceptible to overload from very strong out-of-band interference.

You could also whip up your own bandpass filter if you did experience overload on your favorite SWL band.

I suspect this would be more of an issue in Europe than USA

Larry, I hear plenty on the SWL bands, but the only problem is that I don't have a reference gen cov rx to compare it to.

7579. Re: [orion565] RX366

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 21:22:26 UTC
From: Barry N1EU
Topic: 7546 Message: 7579

I spoke too soon - I'm listening to a USB signal on 11095Khz and the
RX366 is suffering from out-of-band interference that isn't affecting
another radio I'm listening on.

So there probably ARE issues if you want to do serious SWL'ing. Sorry
for leading anyone astray.

Does the old receive do this? I had not noticed it.

C. Richard Pumphrey

NOTICE: It is okay to print this email. Paper is a plentiful, biodegradable, renewable, recyclable, sustainable product made from trees that provide jobs and income for millions of Americans. Thanks to improved forest management, we have more trees in America today than we had 100 years ago.

[Non-text portions of this message have been removed]

7581. Re: RX366

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 22:14:52 UTC
From: John
Topic: 7546 Message: 7581

The stock receiver doesn't suffer from this.

The general coverage path in the tx/rx board used is basically wide open. Meaning you can go anywhere with it, but it let's everything through. Like having the barn door open when all you want is a trickle from a hose....

So if you want a 366 for general coverage, then don't, instead, get it for kick butt ham band blocking/performance. Then use an RX320 for all your general coverage swl and broadcast listening.

John

7582. 565v3.026 ready at TenTec for download

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 22:15:40 UTC
From: John
Topic: 7582 Message: 7582

Version 3 of the Orion II 566 is now ready for download.

Go to
www.tentec.com
Hover over downloads
Click on transceiver downloads.

Scroll down to the 566 section.

Click on the link on the right column titled "Firmware Ver3.026".

Download/run it.
It will install the Orion II update utility and ruf files into:
C:\Program Files\Ten-Tec\OrionII Firmware Update

To view the "What is V3 file"
Click on
Windows Start
All Programs
Ten-Tec
OrionII Firmware Update
then click on What is V3
And it brings up the 74474 document already posted.

To run the update utility....
Click on
Windows Start
All Programs
Ten-Tec
OrionII Firmware Update
then click on Orion II FIrmware Update

It should report Version 4.15 of the updater in help about.

Ensure you have the proper com port selected.
This is found in "Settings" Setup
The very first time I run update, I usually uncheck stop on errors, and then re-check it, then select close.
This ensures that it will stop if there are any programming errors.

Then perform the normal update procedure.
Place the radio into update mode, (hold down USER2 while turning it on until FLASH UPDATE MODE Is shown on the Orion II)
Select Process, Update Radio, and then select the 566v3.026.ruf file.

You will see the line numbers slowly increase on both the update program screen and on the radio's display.

Follow the RAM Clear/Master Reset steps outlined in 74474, the what is V3 document.

Then enjoy SAF and all the new features.

John

7583. RX366 and general coverage

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 22:21:42 UTC
From: John
Topic: 7583 Message: 7583

The RX366's general coverage filter is wide open. Meaning just about everything gets in. It can be used to listen to broadcast or SWL, however, if you have anything near you that is strong, it will also make it in and degrade your listening pleasure.

So, we advertise it as 160-10m for a reason.

It "Can" be tuned to 930AM, and in different situations may sound OK, but we can by no means advertise it as a General Coverage receiver.
It will work, but at greatly reduced specs, and depending upon your situation, your mileage may vary from "great general coverage" to "worst thing since chicken livers".

Hope that helps,
John

7584. Re: RX366 and general coverage

Remember, the RX366 was designed for optimum performance for hambands for extremely serious contesters and DXers. It is a real top notch contest performer.

John Henry
ok, I go home now, 73 for now

7585. Does updating to V3.026 do that much for an Orion II without the RX366?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 22:28:55 UTC
From: k1fpv
Topic: 7585 Message: 7585

I don't have the RX366 in my Orion II and am wondering if I'll really gain anything by updating the firmware. I'm happy with the Orion II right now the way it is. Any suggestions or comments?

Bill/K1FPV

I like using my RX-340 as my kick-ass general coverage SWL/BC receiver. ;=)

In my humble opinion it is worth upgrading to the V3 firmware. A lot of development and testing has gone in to it over the last couple of months and its of very good quality. I cannot comment on 566 (orion II) since I was part of the 565 (orion 1) testing...

I would suggest upgrading and leave it running for a while. It is easy to go back and forth between versions anyway.

If you settings are precious to you and you are afraid loosing them I can send you a Backup / Restore program to capture a big part of the settings.

Anyway, I love the new V3 firmware. Sound quality, saf function and user control is really good. Other beta testers have used 566 in recent contests and from what I picked up it behaved very well.

Best regards, Onno pa1ap

7588. A dilemma installing V3 on Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-01 22:43:16 UTC
From: floydsense
Topic: 7588 Message: 7588

First time trying to install any level of firmware on the Orion II here. Followed the instructions to the letter for V3 and preparing the O2 for the update. When the Update program started, I set the com port to COM1, which is a real serial port to the Orion and one that's been used daily for the past 8 months. Then, started the update, specifying the V3 .ruf file. No errors, but nothing really happened and the last line of the Update window said "Using serial interface: Using serial interface". Waited a while, nothing happened.

Then made a big mistake - recycled the Orion II and ran update again. I noticed in the port setup there was an option to ignore Orion responses and not check for errors and I selected that option (no check in box). Update then started and the bottom line of the window indicated it was on statement 4 of 10645, after about 5 minutes. Screen on O2 indicated Flash being erased. Then nothing more.

Killed update, cycled O2 power off/on, but it appears the firmware was erased. Tried the same process with the 2.044 firmware, NOT ignoring errors, and that got me an error message indicating communications with the O2 had failed. So, where to go from here?

Operating system is Win 7 and as I said the Com1 port is a real port that works just fine. I suppose I could try this from an XP laptop, but is there something else about the Com port that I've missed?

As far as I know you cannot "destroy" the orion this way.

Couple of things you might want to check;

1) installer version... When you download the TT firmware it will install the latest version... Please check if you are indeed starting the correct one.. it should be version 4.15... start the flash update program and click help to find this information

2) settings; serial port > correct com port > stop on error...

3) update radio > select file and there you go (normally..)

Were you able to use the radio through remote control software prior to the "dilemma" ?

Can you confirm that the flash process can be started again on orion (push-hold user1 and pwr on)? As long as thats the case its a matter of pushing the Bytes into the orion... As far as I know the flash program does use verification of Bytes exchanged with Orion during the upgrade.

In case you have a second computer perhaps you can install the flash updater on that one and see how that goes. It might be a comptability issue.

Last but not least if you like a bit of hacking;

1) connect computer to orion through correct serial port
2) start a serial terminal program, 57600, 8 bits, hardware handshake.
3) power on the orion... using push-hold user1 + power on
4) the terminal program should display the message "ORION START" (i just checked)
5) within the terminal type the following ?V this will show something like "VER 1002-566"

If step 4 and 5 are providing information this will confirm your serial connection is operational... Thats good news. It also confirms the bootloader is still happy with you....

If above works something is cooking with the actual update program. Driver conflicts or whatever...

Hope this helps and let us know what you find. Best regards, Onno

Thanks for the truth, Barry,

I don't listen to SW anyway, so it's about the enhanced ham performance for me anyway.

Topic: 7588 Message: 7591

I know you can't "destroy" the Orion this way, but I can assure you that it's possible to get your flash memory erased and end up with a comatose Orion II. I've succeeded in getting V3 running on the Orion II, but I'm not pleased with how I had to do it.

Here are facts:

1. For whatever reason, it's not possible to do the update from my 32 bit Windows 7 system using the serial port cards I have installed. Since the Update program tells you virtually nothing about the nature of the error it discovered, I don't know the nature of the error. What I do know is that these ports run the normal communications with the Orion just fine, using every logging program I've used here. Since the Orion doesn't "play well" in this environment, it will be for sale in the near future.

2. While the conventional wisdom is to NOT use a USB/serial converter for the Update process, I was left with no other alternative since my laptops have no serial ports. Using a USB/Serial converter with a Prolific chip set, running with my Win XP 32 bit system, the Update worked correctly. Total elapsed time was 303 seconds.

3. Hyperterminal is no longer shipped free with Windows 7 - not sure if that started with Win 7 or Vista. So, trying a "terminal" program to see if that can communicate with the Orion II is not quite so easy. Yes, I know there are other free trial terminal programs available.

4. As you said, firing up the Orion II with hyperterminal (under Win XP) resulted in the "Orion Start" message as you indicated. Good to know.

5. The same problem occurred when I tried to reinstall 2.044, so whatever the problem is, it apparently isn't unique to the V3 firmware install.

Other comments:

I did have a serial port monitor program on my Win 7 system that I could use to monitor the Update when it failed. I could see Update opening the port and sending a string that began with "3F 56 0D" which I interpret as "?V" and CR. According to your comments, that should have resulted in the firmware level being returned. It appears that there was no response seen. I assume that RTS/CTS are being used but did not monitor those lines. There are many possibilities for the error - one being that the application isn't raising RTS or isn't waiting for CTS before sending. There are other combinations that would cause the same problem. Why it works fine on XP and not on my Win 7 machine will remain a mystery until I have time to monitor and trace the failing situation.

Thanks for your ideas as they did lead me down the right path!

Topic: 7588 Message: 7592

I was just going to ask a question concerning this BEFORE I did my update. I'm all set, but as I remember...I used COM 8. Can anyone confirm this before I get started on my O2. (just for the heck of it, please report the com port you used... see if everyone is on the same page)

And Floyd, a post just before yours from Onno said the following (you might try):

Couple of things you might want to check;

1) installer version... When you download the TT firmware it will
install the latest version... Please check if you are indeed starting
the correct one.. it should be version 4.15... start the flash update
program and click help to find this information

2) settings; serial port > correct com port > stop on error...

3) update radio > select file and there you go (normally..)

Were you able to use the radio through remote control software prior to the "dilemma" ?

Can you confirm that the flash process can be started again on orion
(push-hold user1 and pwr on)? As long as thats the case its a matter of
pushing the Bytes into the orion... As far as I know the flash program
does use verification of Bytes exchanged with Orion during the upgrade.

In case you have a second computer perhaps you can install the flash
updater on that one and see how that goes. It might be a comptability
issue.

Last but not least if you like a bit of hacking;

1) connect computer to orion through correct serial port
2) start a serial terminal program, 57600, 8 bits, hardware handshake.
3) power on the orion... using push-hold user1 + power on
4) the terminal program should display the message "ORION START" (i just checked)
5) within the terminal type the following ?V this will show something like "VER 1002-566"

If step 4 and 5 are providing information this will confirm your serial
connection is operational... Thats good news. It also confirms the
bootloader is still happy with you....

If above works something is cooking with the actual update program. Driver conflicts or whatever...

Hope this helps and let us know what you find. Best regards, Onno

Subject: [orion565] A dilemma installing V3 on Orion II

First time trying to install any level of firmware on the Orion II here. Followed the instructions to the letter for V3 and preparing the O2 for the update. When the Update program started, I set the com port to COM1, which is a real serial port to the Orion and one that's been used daily for the past 8 months. Then, started the update, specifying the V3 .ruf file. No errors, but nothing really happened and the last line of the Update window said "Using serial interface: Using serial interface". Waited a while, nothing happened.

Then made a big mistake - recycled the Orion II and ran update again. I noticed in the port setup there was an option to ignore Orion responses and not check for errors and I selected that option (no check in box). Update then started and the bottom line of the window indicated it was on statement 4 of 10645, after about 5 minutes. Screen on O2 indicated Flash being erased. Then nothing more.

Killed update, cycled O2 power off/on, but it appears the firmware was erased. Tried the same process with the 2.044 firmware, NOT ignoring errors, and that got me an error message indicating communications with the O2 had failed. So, where to go from here?

Operating system is Win 7 and as I said the Com1 port is a real port that works just fine. I suppose I could try this from an XP laptop, but is there something else about the Com port that I've missed?

7595. Orion 565 supply glitches

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-02 01:55:22 UTC
From: Martin Sole
Topic: 7595 Message: 7595

This started happening a week or so ago, it's not firmware dependent.

At power on the radio works normally but after a few minutes there will be a pop. The screen, meter and leds flash and the radio restarts. This typically happens several times spaced at several minutes. Then it seems to settle down and will run all day.

It may well be my power supply. I haven't yet tried leaving it on 24 hours to see if it happens then or not. Just wonder if this might be a known problem, or rather a problem with a known fix!

Thanks

Martin, HS0ZED

It sounds as if your backup battery might be low. This happened to me after 12 months of usage (radio continuously on). The battery is suppose to last for at LEAST 10 years, go figure and it's not located at an easy access spot (behind the front panel).

Just my two cents.

Thank you Onno. As a matter of fact I had the hood off a couple of months ago and thought I would check the battery voltage while I was there. It measured about 0.1 V above manufacturer specs so I'm assuming that it is good. And you make a good point , because I did go back and try to reload 2.064x11 last night after having no success with V3 and I couldn't get IT to start up either. so I reloaded V3 and just turned the power off and went to bed. This morning I turned the power on and it came right up in the new version and has been running all day with no issues. Now I'm afraid to turn it off again!

Subject: [orion565] Re: V3 update not successful yet

Recently I had simillar experience and in my case the cpu battery became bad. It kept on looping after power on, showed all the boot messages and even allowed me to answer yes to the questions raised. But then it looped to the start again.

Your case might be different but that was my experience. replacing the battery fixed it for me and it seems there lifetime is about 6 years.

Can you confirm if you can load a different firmware version which will make the orion operational? If none of the firmware versions will make orion operational it sound logical the battery is flat...

Best regards, onno

Hi Martin,
There is a power distribution board A9 that was causing some similar issues on the orion 566 a couple of years ago. Take a look at the electrolyThetic capacitors on the A9 board for a sign off deformation or swelling. If you see any, go to: http://www.ronc.users.sonic.net/A9_Fix.html for how to do the fix. The power connectors on the 12v power lines con slacken up and get loose on the rear connectors of the radio. Send tectec an email and the will sell you some new connectors for the power lines rather inexpensively. Next thing to check would be your power supply, in fact, the poower supply is what I would check out FIRST!! Hope this helps!

Hi Floyd,
My usb adaptor is also a prolific. That little window that shows com1,com2, and com3 can be moved down to find the port that your 566 is on. In my case it was com5 for both of my 566s. Anyway, glad you got it installed and hope that you will play with the SAF function, it is really great on weak sigs or noisy band conditions. They put out V3.026 firmware today for the 566 to correct a small data bug with the new deluxe sub receiver board interface. I understand that the deluxe sub receivers are flying out the door, so if you want one, don’t wait too long to order yours!!
Hope this helps!! I have v3.026 on both of my 566ats and it really makes it a better radio!!! Quieter receiver is noticeable!! SAF really is a huge improvement for digging out the weak or noisy ones!! They had a version of SAF in the Omni 6+that was turned on when you turned on the noise blanker. It worked so well that I did not sell that omni 6+ because of that function. Now I can sell it, but I’ve had it so long that it has become a dear friend and I don’t think I could bear not seeing it in the shack!!
Enjoy Version 3, it is like getting a whole new radio for free!!!!!

I was just going to ask a question concerning this BEFORE I did my update.
I'm all set, but as I remember...I used COM 8. Can anyone confirm this
before I get started on my O2. (just for the heck of it, please report the
com port you used... see if everyone is on the same page)

And Floyd, a post just before yours from Onno said the following (you might
try):

Couple of things you might want to check;

1) installer version... When you download the TT firmware it will
install the latest version... Please check if you are indeed starting
the correct one.. it should be version 4.15... start the flash update
program and click help to find this information

2) settings; serial port > correct com port > stop on error...

3) update radio > select file and there you go (normally..)

Were you able to use the radio through remote control software prior to the
"dilemma" ?

Can you confirm that the flash process can be started again on orion
(push-hold user1 and pwr on)? As long as thats the case its a matter of
pushing the Bytes into the orion... As far as I know the flash program
does use verification of Bytes exchanged with Orion during the upgrade.

In case you have a second computer perhaps you can install the flash
updater on that one and see how that goes. It might be a comptability
issue.

Last but not least if you like a bit of hacking;

1) connect computer to orion through correct serial port
2) start a serial terminal program, 57600, 8 bits, hardware handshake.

3) power on the orion... using push-hold user1 + power on
4) the terminal program should display the message "ORION START" (i just checked)
5) within the terminal type the following ?V this will show something like "VER 1002-566"

If step 4 and 5 are providing information this will confirm your serial connection is operational... Thats good news. It also confirms the bootloader is still happy with you....

If above works something is cooking with the actual update program. Driver conflicts or whatever...

Hope this helps and let us know what you find. Best regards, Onno

When I went to Setup in Update, only my first three com ports (com1, com2, com3) were offered as options. It should make no difference which you use, as long as that's the one the Orion is on!

Hi Bill,
The V3 receiver is quieter....noticeably!!,the SAF function is amazing..makes it a new radio!!,cleans up the errors on the screen, radio is made into very high end excellent transceiver. a brand new better radio for $0. The quieter receiver and the SAF make it an absolute necessity to go to V3. A year of programming by 2 systems programmers went into V3 WITH ABOUT 25 beta testers making sure that things worked as we wanted them to be working.I have v3.026 loaded in both oh my 566 es. It just makes the radios work better!! They shipped my 2 new sub receivers today, so I am anxiously waiting for those to arrive.
Enjoy your GREAT new Radio!!!!!!

I don't have the RX366 in my Orion II and am wondering if I'll really gain anything by updating the firmware. I'm happy with the Orion II right now the way it is. Any suggestions or comments?

It looks like this install may be too complicated for me, just looking at it. I read the instructions and don't have a clue where to begin. I wonder if I can take it over to ten Tec and get them to do it? If I get the new receiver can I still use the old one too? I like the broadcast band, usually leaving it on 670 kc for the oldies station. Sometimes use it to listen to ham bands also. I'm not an engineer, but an insurance guy and have two Master's degrees. I have been a ham for many years but electronic expertise is not my field.

If I have any bitch about TT, it's that damn cheap Molex power connector they use. I was having the same thing happen, especially if I inadvertently bumped the power cable when working around the back of the rig.

I'm seriously thinking about replacing that thing with an Anderson PowerPole connector, one that is tight and positive. I know a buddy of mine did exactly that. I upgraded my Orion II to the new firmware today, and bumped that plug...bang...radio blinked as you describe. I noticed that the female connector on the cable is actually burned and discolored from arcing! Powerpole connector for sure. I'll probably do that when I install the new second receiver board this weekend.

In the meantime, make sure the radio is off, pull out that plug, and with a small, thin flat blade screwdriver, gently slip in in the slit on that male pin on the connector on the radio. That will make for a more positive connection. Secondly, secure that cable with a tie wrap or something to keep it from moving around at all. Should help.

NOTE TO TT: How 'bout a better connector? Hmmmm

I echo Kirby's enthusiasm. I installed it on both my Orion and my Orion II today, and I must say, the radios are sounding absolutely great! The SAF function is marvelous. I was listening on 160 tonight and able to POP up weak signals as promised. I'm just learning how to use it, of course, and I'm really looking forward to getting my 366 installed this weekend.

By all means, load it up. It is worth the effort. I used my old XP machine with a real hardware COM 1 connection and it loaded perfectly on both radios first time. This is not a difficult process. Follow the directions as presented in the download package and it's hard to go wrong.

Good luck and go for it.

Thanks for the replies, a couple of points.

The battery in my 565 died about a year ago. I replaced it with a coin holder and a CR2032 calculator battery. It may well be that this is too small for the job and that it is failing. Need to investigate that.

As to the power connector, I agree, It really would seem to need something more robust both electrically and mechanically. Mine overheated and melted the connector on the board. I removed it and wired a pigtail of sufficiently large wire through the hole and about 8 inches long to a pair of 30A powerpole connectors. These go to my 40A continuous super smooth and apparently glitch free ex commercial radio base station power supply, something from a Motorola VHF repeater I think.

Regards
Martin

Martin I 2nd Kirby's suggestion. It may well be the electrolytics on the Power Distribution board. When they go all kinds of weird things begin to happen.

Bill
I have the 565, and believe me you will be schocked whwn you hear the radio after the update.
I do not have the RX366 either, but it blew me of the chair. Especially the SAF is unbelievable in both SSB and CW. And the receiver noise floor has changed dramaticaly. I have the same feeling as when I turned from my OMNI VII to the ORION Dont miss it....

7612. V3.025 Not really a snag but...

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-02 06:47:07 UTC
From: Martin Sole
Topic: 7612 Message: 7612

I really like it. As most have said the SAF works great and well worth the upgrade alone. Other changes seem to have made the receiver sound a bit better and now with the ability to set which items get tracked across the 2 receivers it's even more flexible.

One little gripe as I put it to the test, been chasing VP6T, 18m CW before they closed last night, FW, FO and TO4M plus some others I'm noticing that the key presses seem a lot less responsive. It seems I need to deliberately press and hold the keys for them to be actioned, as if they are not being scanned fast enough. I see this with the push action on the rotary controls not just the keys. Definitely seems slower than it was. I hate to say it's feeling sluggish, though to me it is. Anyone else notice this?

Not a battery expert at all but measuring the voltage over the battery on my end did show the voltage to be below spec. Will need to look up what value I wrote down. But I still had the issue... Ordered battery at TT and week later replaced the battery and problem gone... I also noticed the voltage was higher than the specs... this measured with battery outside the TT..

If you can upgrade and after a night of sleep the unit starts again it seems to me the battery has recovered during the night but will discharge a little more soon... How cold is the shack? Just like car batteries I see most people struggle during the winter period trying to start their engine...

Regards, Onno

>
>
> Thank you Onno. As a matter of fact I had the hood off a couple of months ago and thought I would check the battery voltage while I was there. It measured about 0.1 V above manufacturer specs so I'm assuming that it is good. And you make a good point , because I did go back and try to reload 2.064x11 last night after having no success with V3 and I couldn't get IT to start up either. so I reloaded V3 and just turned the power off and went to bed. This morning I turned the power on and it came right up in the new version and has been running all day with no issues. Now I'm afraid to turn it off again!

> 1. For whatever reason, it's not possible to do the update from my 32 bit Windows 7 system using the serial port cards I have installed. Since the Update program tells you virtually nothing about the nature of the error it discovered, I don't know the nature of the error. What I do know is that these ports run the normal communications with the Orion just fine, using every logging program I've used here. Since the Orion doesn't "play well" in this environment, it will be for sale in the near future.
>
> 2. While the conventional wisdom is to NOT use a USB/serial converter for the Update process, I was left with no other alternative since my laptops have no serial ports. Using a USB/Serial converter with a Prolific chip set, running with my Win XP 32 bit system, the Update worked correctly. Total elapsed time was 303 seconds.
>
> 3. Hyperterminal is no longer shipped free with Windows 7 - not sure if that started with Win 7 or Vista. So, trying a "terminal" program to see if that can communicate with the Orion II is not quite so easy. Yes, I know there are other free trial terminal programs available.
>
> 4. As you said, firing up the Orion II with hyperterminal (under Win XP) resulted in the "Orion Start" message as you indicated. Good to know.
>
> 5. The same problem occurred when I tried to reinstall 2.044, so whatever the problem is, it apparently isn't unique to the V3 firmware install.
>
> Other comments:

>
> I did have a serial port monitor program on my Win 7 system that I could use to monitor the Update when it failed. I could see Update opening the port and sending a string that began with "3F 56 0D" which I interpret as "?V" and CR. According to your comments, that should have resulted in the firmware level being returned. It appears that there was no response seen. I assume that RTS/CTS are being used but did not monitor those lines. There are many possibilities for the error - one being that the application isn't raising RTS or isn't waiting for CTS before sending. There are other combinations that would cause the same problem. Why it works fine on XP and not on my Win 7 machine will remain a mystery until I have time to monitor and trace the failing situation.

If you like I can walk you through by phone. Just send me an email and time.

Its pretty simple;

1) first confirm your serial connection works. Just to make sure prior to any upgrade stuff... Use any software to control the orion and you would know. I can also send you backup / restore program which will also confirm if serial connection works...

/// just make sure step 1 is confirmed before attempting upgrade ///

2) switch off your orion... push-hold user1 and power unit on... Screen should say "flash update"

3) start update program, select the correct comport and select update

4) it should start and you will see a counter counting on both orion and computer program. wait for about 5 minutes and your done.

5) unit reboots and you should see nice screens with V3 code ;-)

6) to avoid conflicts you have to power off / on the unit twice with key combination to ensure everything is cleaned up... this process looks very complex on paper but cannot harm your orion...

Thats all.. Best regards, Onno

When the Update program started, I set the com port to COM1, which is a real serial port to the Orion and one that's been used daily for the past 8 months. Then, started the update, specifying the V3 .ruf file. No errors, but nothing really happened and the last line of the Update window said "Using serial interface: Using serial interface". Waited a while, nothing happened.
> >
> > Then made a big mistake - recycled the Orion II and ran update again. I noticed in the port setup there was an option to ignore Orion responses and not check for errors and I selected that option (no check in box). Update then started and the bottom line of the window indicated it was on statement 4 of 10645, after about 5 minutes. Screen on O2 indicated Flash being erased. Then nothing more.
> >
> > Killed update, cycled O2 power off/on, but it appears the firmware was erased. Tried the same process with the 2.044 firmware, NOT ignoring errors, and that got me an error message indicating communications with the O2 had failed. So, where to go from here?

I installed Version 3 this morning from a XP machine and it went very smooth without any problems.
I used a Keyspan usb/db9 converter and all 10645 lines loaded without any problems
Did the Master Reset and the Memory Clear
I do notice the Orion II is quieter and more responsive
I will hold off on getting the sub-receiver until I get and see more comments from the Orion usersdeMikeKQ0B

You might want to check your Control Panel Systems device to see the Comm Port your USB cable is plugged in
I generally unplug all other usb devices when I do install of Orion firmware
I have a Win7 machine but never use it with the Orion
good luck

From: billw5ao
Topic: 7618 Message: 7618

John Henry for President!

Love the SAF on cw and never expected it would be useful on SSB but it gives essentially a tone control boost and makes receive sound wonderful.

1. I think my POD Enc Rate follows VFO-A Enc Rate instead of menu setting for POD Enc Rate.

2. Didn't we used to have fast and slow encode rate for fast SSB and slow for CW? If so, that is missed. Fast is good for SSB but too fast for CW at 10hz, maybe I will try 1 hz on cw.

3. I think my max power output is down now with v3.026, now getting 76 watts with PWR at 100 (LP-100A). Amp puts out 1500 with 35 so not really a problem but I remember getting 100 out with a previous version. I have never set the output pot.

Installed easily on a mac using windows 7 through vmware fusion emulator and through a USB/Serial converter, although the update took a long time.

Overall excellent upgrade, thanks.

Looks very good on my 566AT.

Update initially went south (WinXP 32-bit on a VirtualBox running on Ubuntu 11.10 using Prolific USB->serial adapter, Combo used to work for updates, but alas not this time!)

Found an old version of XP (Native multiboot) on my laptop, and ran update here (again using the Prolific adapter) no problems this time, followed instructions to the letter and everything works fine! Oh, one thing though: the Prolific adapter installed as COM4 - that didn't work, had to rename to COM1 - then it worked just fine - riddle me that?

No RX366 here, and no immediate plans to acquire one...

From: Sam W Jacobs CET
Topic: 7618 Message: 7621

As of right now, I cannot get V3 to load. My emulator (USB to Serial) says I'm on COM5 (I unplug it and it goes away, plug it back in and it shows COM5). I will play with it some more this morning and if I can't get it to load I'll call T*T. It might be that the settings for baud rate, etc. are wrong, but I don't want to change anything yet as I'm just not sure.

I see "bugs" are already surfacing, I hope John and the Gang can address them lick-a-dee split. No one's perfect.

73,
Sam

Love the SAF on cw and never expected it would be useful on SSB but it gives essentially a tone control boost and makes receive sound wonderful.

1. I think my POD Enc Rate follows VFO-A Enc Rate instead of menu setting for POD Enc Rate.

2. Didn't we used to have fast and slow encode rate for fast SSB and slow for CW? If so, that is missed. Fast is good for SSB but too fast for CW at 10hz, maybe I will try 1 hz on cw.

3. I think my max power output is down now with v3.026, now getting 76 watts with PWR at 100 (LP-100A). Amp puts out 1500 with 35 so not really a problem but I remember getting 100 out with a previous version. I have never set the output pot.

Installed easily on a mac using windows 7 through vmware fusion emulator and through a USB/Serial converter, although the update took a long time.

Overall excellent upgrade, thanks.

After installing the new firmware on my Orion 2 I noticed the H/W mic gain does not change the audio output. I did both resets and reloaded the firmware.
Does anybody else have this same problem?

Sam

You can change the comport settings in Control Panel
System/Hardware/Comport under advanced you can change it to another comport
number.

i have also updated my 565 to V3
which went smoothly using the procedure describe in the addendum

my setup is iMac running osx 10.6.8 with VMware running Xp and usb/serial adapter

i only spent about 1/2 hours playing with the radio after the update

BUT

i have also noticed the same sluggish response of the controls

i also noticed my power output is now 120 watts when power set to 100 and the meter does full beg to the right ;-(

had to turn power to 88 to get 100 watts and normal fullscale meter reading

like the SAF, receiver seems hotter

hope to get more time later today to run some more thorough testing

ok, I need some help on this one.

The Orion II 566's I have at TenTec only have one pot on the logic board, and that is for the s-meter.
As far as I know, there is no hardware mic gain adjustment in the 566.
I don't think it ever shipped with a hw mic gain adjustment. I could be wrong since I was not part of the early Orion 2 development or shipments.

With that being said, I did re-test the software MIC gain adjustment from the front panel. I used a 566 with the 366 and a 566 with the stock rx, using a 708 and a Regal mic. I found that I can adjust power output by using the MIC gain on the front panel.

The 565 on the other hand has three pots on the logic board, one for contrast, one for smeter, and one for hw mic gain. I've verified that the 565 is also working properly when one adjusts hw mic gain and the software mic gain.

So I need a bit more info on this one to help out.

Thanks,
John Henry

7629. v3.026

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-02 17:15:46 UTC
From: billw5ao
Topic: 7629 Message: 7629

I pressed/held user I after inputting my band frequencies and instead of saving it did "recall" and recalled all the default frequencies.

After re-inputting all 4 band/VFO frequencies I hit user 2 and same result; wiped out all frequencies and returned defaults.

Bill W5AO

7630. Re: v3.026

Topic: 7629 Message: 7630

Hi Bill,
Did you press/hold User 1 until you saw the message pop up that says:
"Storing Parameter Set #1"
This should take about a second of hold time before the message comes up.

I just ran a test where I had
14.2501 in A
14.0002 in B
14.0003 in C
14.0004 in D
Pressed and held USER1 until I saw the message, released it.
I then manually changed all VFO frequencies in the bands to
13.990 for A
13.991 for B
13.992 for C
13.993 for D
Then I pressed USER1 to recall, and the frequencies came back correctly as:
14.2501 in A
14.0002 in B
14.0003 in C
14.0004 in D

I tested this in both a 566 with 3.026 and in a 565 with 3.025.

Anyone else finding similar results to Bill or are you getting the same result that I am in the rigs at TenTec.

Ensure that you hold the button down until you see the message stating that it is storing. Otherwise it will definitely do a recall.

John

Hi Bill.

I too, noticed the power drop also measured with an LP-100A.

I think the SAF works as a tone control, as it seems to flatten out the audio.

Unlike some of the others, My noise floor seems to have risen73,

Andrew

When I first turn on my ORION II I frequently get popping noise in the speaker, the screen flickers and the S meter jumps around. This morning it lasted about 15 seconds. Sometimes only does it a time or two or is non-existent. Is this likely the capacitor problem on the A9 power board? I note that Mouser no longer stocks the Xicon 140-ESRL 50V100RC electrolytic s recommended by N6IE. They list Lelon 140-RXJ471M1HBK132P as a substitute. The Lelon caps are also listed as Low ESR and "good ripple" specs. Am I on the right track and what Caps are now recommended? Lynn Finch, W2MSJ

Hello

140-RXJ471M1HBK1325P
50V 470uF 105C

Those are the ones I installed in 2010 and no problems.

While I had the covers off, I change the molex connector to Power Poles.

No problems there either.

We found the problem, and have it resolved.
I would like to wait for about a week, collect inputs on any other issues found during that time, and make a public release then.

Thanks for bringing this to our attention, we'll resolve 'em if we can reproduce 'em.

Thanks,
John Henry

If the capacitors at Radio Shack are low ESR perhaps but if, as I suspect, they are not then I'd wait for the Mouser (or Newark or similar) version.

We found the problem, and have it resolved.
I would like to wait for about a week, collect inputs on any other issues found during that time, and make a public release then.

Thanks for bringing this to our attention, we'll resolve 'em if we can reproduce 'em.

Thanks,
John Henry

I had to replace the caps and the power connector molex over the last 3 years on my 01. replacing the caps is not hard, and I best I remember, fairly easy to get to. The power connector.. it's a different story but do-able

Martin I 2nd Kirby's suggestion. It may well be the electrolytics on the Power Distribution board. When they go all kinds of weird things begin to happen.

start_update

i did a reload of V3.025 on my 565
and
followed the procedure one more time

things are back to normal

power output setting of 100 give me 100 watts

control responses seem to be back to almost the same as before
the control action take place but some times the display just lags a tad bit behind... i think i am being a bit critical on this one because i dont normally look at the display...base it more on what my ears hear...so this display response lag may have existed for me before and i learned to ignore it because of the way i operate

i only notice the display lag for
1. BW
2. PBT

the display mic gain control work as well as the menu driven h/w mic gain

right now for me everything is looking fine

end_update

JH and gang...thank you for your effort to get to us TT user some really f/w and keeping our Orion at the top of the heap

7642. Re: [orion565] 566 Intermittent noise on start-up

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-03 02:40:25 UTC
From: K Van Horn
Topic: 7634 Message: 7642

Hi Lynn,
The new caps should work if they are Low ESR.
I have extras of the mouser caps if you need them. Because I have 2 566s, I have replaced those caps in both radios, and I also keep a spare modded A9 board..just in case. I must admit that I have never had one of the caps fail. When TT found they had a problem, they IMMEDIATELY made a change at the factory that fixed the problem.

Subject: [orion565] 566 Intermittent noise on start-up

When I first turn on my ORION II I frequently get popping noise in the speaker, the screen flickers and the S meter jumps around. This morning it lasted about 15 seconds. Sometimes only does it a time or two or is non-existent. Is this likely the capacitor problem on the A9 power board? I note that Mouser no longer stocks the Xicon 140-ESRL 50V100RC electrolytic s recommended by N6IE. They list Lelon 140-RXJ471M1HBK132P as a substitute. The Lelon caps are also listed as Low ESR and "good ripple" specs. Am I on the right track and what Caps are now recommended? Lynn Finch, W2MSJ

Thanks Onno. Your point is well taken, because I have always had a problem with the radio starting up with a new firmware install (I bought the radio used in 2009). I probably should replace it just on general principle if nothing else. Unless it was replaced when the factory performed the V2 upgrade 5 years ago, then it is the original battery.

Subject: [orion565] Re: V3 update not successful yet

Not a battery expert at all but measuring the voltage over the battery on my end did show the voltage to be below spec. Will need to look up what value I wrote down. But I still had the issue... Ordered battery at TT and week later replaced the battery and problem gone... I also noticed the voltage was higher than the specs... this measured with battery outside the TT..

If you can upgrade and after a night of sleep the unit starts again it seems to me the battery has recovered during the night but will discharge a little more soon... How cold is the shack? Just like car batteries I see most people struggle during the winter period trying to start their engine...

Regards, Onno

--- In orion565@yahoogroups.com, art davis <n4uc@...> wrote:

>

>

> Thank you Onno. As a matter of fact I had the hood off a couple of months ago and thought I would check the battery voltage while I was there. It measured about 0.1 V above manufacturer specs so I'm assuming that it is good. And you make a good point , because I did go back and try to reload 2.064x11 last night after having no success with V3 and I couldn't get IT to start up either. so I reloaded V3 and just turned the power off and went to bed. This morning I turned the power on and it came right up in the new version and has been running all day with no issues. Now I'm afraid to turn it off again!

Date: 2012-02-03 07:51:53 UTC
From: Barrett Thompson
Topic: 7645 Message: 7645

The photo on page 3 of the V3 Firmware Addendum (74474) shows the ORION II RX menu with a 'Sweep Range' option at the top of the list. On my ORION 565 running v3.025, my RX menu shows a 'Sweep Display' option in this menu position, with values of 'On' and 'Off'. Is there a way to adjust the sweep range on the 565/v3.025?

73,
Barrett / KE4R

On my Orion II, if the notch button is set up for SAF (either or both Rcvrs), when you hit the RIT button the left half of the S in SAF is blanked out. This happens to both the Ss whether SAF/NOTCH Track is set on or off.

With V3 on my Orion II, turning on the VOX in CW mode mutes both the main and subreceivers (VOX setting have no effect on this). The Orion is still in receive mode with S meter working. Never noticed this on 2.044 - does it work that way there?

7649. Possible 3.025 Model 565 Firmware Bug

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-03 15:11:58 UTC
From: Russ
Topic: 7649 Message: 7649

PBT values in the band stacking registers do not display correctly when the PBT/BW control is in the BW position. To reproduce bug set a PBT of +100 in register A, leave B at 0, enter +700 in C, and leave D at zero. With the PBT/BW control in PBT setting cycle thru the registers and all the PBT values will be OK. Change the PBT/BW control to BW and cycle through the registers and see the wrong PBT values, probably zero. The important thing is that the actual effective PBT value as set in each register is active, not the incorrect value. This is evident when the PBT/BW control is set to BW and the control moved a slight amount which returns the display to the actual value. In effect the registers will always operate with the desired PBT setting, it's just that the setting as shown on the display can be wrong. Minor bug, a similar bug was seen in v2 firmware.

Yeah, pixel glitch of some kind. You have to cycle SAF off and then back on to get the other half of the S back.

Don't use RIT very much here, so not a problem for me. I'm sure John will fix all this little sh*t as time goes on.

I did that too and I think you might be right. Seems a bit snappier now.

Okay here's another. Try this, again not really a snag but...

Select SAF or Notch make sure they are highlighted so the multi knob adjusts the displayed Fc or width. Now power cycle the radio. When it comes back on the multi knob has no effect even though the notch or SAF are still highlighted. You need to press the notch key to get the focus back. This only seems to apply to the notch and SAF, any other function when selected and the radio is power cycled comes back with the correct focus already set.

Anyone else?

Cheers,
Martin, HS0ZED

I have not upgraded yet but my O-II in 2.044A does the same thing (muting the RX audio). Why would anyone select VOX in CW mode? If there is a reason for it, I'd like to hear about it. Just being curious.

Let me ask that another way - why should I have to turn off the VOX when I want to operate CW?

There is no reason for VOX on for CW on the Orion. But, why should I have to turn it off for CW if I was just operating SSB? None of the other dozens of transceivers I've owned have required that.

I operate very little SSB, so didn't know if it operated the same way on 2.044. Since you say it does, then I guess that's just the way it is and not related to V3. Thanks for the info.

To ensure that a bug is going to get fixed, anybody reporting one
needs to take the time to describe in detail the circumstances that
led to the problem being observed and the provided info allows others
to similarly elicit the problem.

From: nm7x
Topic: 7658 Message: 7658

I've noticed something unusual on version 3 with my Orion 565. When using the stock sub receiver, it's almost impossible to find "zero beat" when tuned to an AM station while in the SSB modes. When using previous versions of the firmware, it is easy to hear the "swishing" or "chuffing" sound when approaching zero beat while in either the USB or LSB modes. With version 3, that sound is simply not there. I've noticed this on WWV as well as with shortwave broadcast stations. I sometimes use the USB or LSB modes on AM signals to eliminate interfere. I also use WWV this way to check the receiver calibration.

Has anyone else noticed this?

can you share some more background on the observation? How do you listen to the station? Through speaker, headset or through audio output at the back? Second how is the Audio menu set? Spkr both?

Thanks and regards, Onno

I've got the RX366 subrx and it's easy to zero beat in AM. In USB, I clearly hear the carrier decrease in tone to zero as I tune up approaching zero beat, and vice versa in LSB. Don't hear anything I would call swishing or chuffing, I just hear a pure carrier tone that is easy to tune to zero from one side.

Thanks John.

By default, my baud rate was set at 9600. Changing it to 57,600 as I thought (and as both you and the manual state) cured the upload problem. BTW, Com5 was correct in my case.

On my 565 update, I have to configured the serial port for 57,600 baud, no parity, 8 data bits and 1 stop bit. I am running 64-bit Windows 7, and the V3 upgrade was uneventful.

Thanks Onno and Barry. I can't speak to how it works with the 566 receiver, as I am using the original. I suppose this is the sort of thing that would be hard to notice unless you are used to zero beating in this specific manner. It's hard to explain the "absence" of a sound.

For reference, I loaded the last official version 1 software, 1.372.
It doesn't matter if it's a speaker or a headphone in use, and I have the audio set to "Both" for "Left" "Right" and "Speaker". The audio gain on the main receiver is turned to zero for this exercise. Mode is LSB or USB, and AGC is set to "Off". Receive Bandwidth is 3 kHz, PBT is zero. Tuning step is 1 Hz.

Now when I tune to 15 mHz, I can clearly hear that I am not on zero beat. As I tune down, I can hear the beat note changing, When it gets within about 4 Hertz I can clearly hear a noise variation ("chuffing", "swishing"...choose your favorite word) at the 4 Hz rate. When I get to 1 or 2 Hz, this beat becomes very pronounced, but predictably slower. It sounds like an AM station rapidly fading in and out. Since the tuning step is one Hz, it's impossible to make it perfectly zero, but it's easy to determine how far the calibration is off within one half Hertz or so using this method.

If I go back to the new version 3 software, this method simply does not work. The only way I can zero beat is to listen to the artifacts on the actual audio. If it's a tone, it shows up as a frequency shift, but on voice you can get a better idea of what the correct tuning is.

Certainly, for normal ham radio operations, this is not a big deal in any way. I just find it to be unusual, and was wondering what causes it. Two things that come to mind are filter centering or perhaps the audio AGC loop is in play here.

In any event, thanks for your responses.

73, Mike, NM7X

Topic: 7668 Message: 7668

It was expected that many reports of bugs would occur in the days following the "release" of the v3 firmware. We're all in this together, so please make your bug reports as helpful as possible, increasing the likelihood of a speedy fix. Please try to not just give a vague description and then voice frustration and throw up your hands. Consider your report the first step in an orderly troubleshooting process that leads to a fix. Try and be precise in describing exactly what elicited the bug and how the Orion was set up. Please try to replicate the bug, try power cycling, try a RAM CLEAR, try to elicit the bug again, etc etc and report on everything you did and observed.

A vague report is simply not very actionable - a little effort can really go a long way in helping improve things for everyone.

Thanks & 73,
Barry N1EU

Simone, the roofing filters didn't change and the dsp filtering didn't change (fairly certain) so I'm not sure how you're losing "selectivity".

On my 565, there's a menu setting under Filtr - DSP Filter Length. I'm not sure if the 566 has that setting but check it and make sure it is set for "199 Taps".

Also, it would be helpful if you gave a more specific description of what you're observing in terms of lost selectivity.

Ok Barry,
thanks so much.
I give you an axample, i'm listeninig the "cliking" from 1 khz up or down station with 200hz of bandwith and 250 hz roofing installed, 199 taps settings.
I'm talking about 566 with no rx366.

With the old firmware 2.044a i never have adiacent clicking.

Unfortunately some transmitters have broad key clicks that can extend
1-2Khz above the fundamental. In those cases, you generally can't filter
them out from your passband.

After the firmware upgrade, did you activate the roofing filters? When I installed firmware V3.026 I found that I had to go through the filter menu and activate the installed roofing filters. Maybe your solution will be something simple like that?
BTW John Henry and his team deserve a pay raise or at least a substantial bonus :)

Ok Barry,
thanks so much.
I give you an axample, i'm listeninig the "cliking" from 1 khz up or down station with 200hz of bandwith and 250 hz roofing installed, 199 taps settings.
I'm talking about 566 with no rx366.

With the old firmware 2.044a i never have adiacent clicking.

Simone, the roofing filters didn't change and the dsp filtering didn't change (fairly certain) so I'm not sure how you're losing "selectivity".

On my 565, there's a menu setting under Filtr - DSP Filter Length. I'm not sure if the 566 has that setting but check it and make sure it is set for "199 Taps".

Also, it would be helpful if you gave a more specific description of what you're observing in terms of lost selectivity.

From: Sam
Topic: 7674 Message: 7674

While you are at it John (programming that is), you might want to consider the new changes with the 60 meter band as you have those pre-programmed as "channels". Damn, that reminds me of something else. Anyhow, you might want to put in the new 60 meter frequency and take out the old, or just add then new one... or we can do this ourselves.

Just a thought.

Just an observation using my 566AT, no 366 and the new software:
NB (reg or H) - activating noticing very little noise blanking (same as 2.039), as in non-functioning
NB - activating makes most SSB audio sound underwater. A bit better than 2.039 but still there
AN - works good

SAF - Still testing

Thanks for all your HARD work. Have a Super Bowl weekend, Go Steelers ! (HA!!)

Just a quick note to share my experience with the HK0NA dxpedition since I installed the new firmware. I have an O1 for that last 4 years or so and while I have some hardware glitches that have plagued me for a couple of years, I never sent it back..yet but this SAF is the BEST THING ever! A couple of contacts on CW using SAF was amazing but tonight I needed 160 SSB to complete all the HF slots and right at 8:00 pm central (in west Ky) AB4IQ called me and said "he's on 160 ssb". So I RAN to the shack and turned on the rig, switched antennas as the amp is warming up.. SOLID +30 STATIC CRASHES from some storms in this part of the country and most of the time +50!!!! WOW... I could hear a word or letter in the static crashes ever so often and on the 1st call I "thought" I heard the op come back with KO but there was too many crashes, and then I heard a few other stations call HK0NA. So after 20 minutes of listening and really tuning the SAF, NR and VFO I got it just right in the noise and gave him a call and he came back and I heard him 100%. Pretty awesome new feature, I'm happy with it. BTW without the SAF on.. he wasn't there at all.

I know others have said this, but it's like a new radio again. Antenna is a inverted L at 50' off the tower with 9 radials running 600-800 watts

Thanks John and the testers

I think you have to have the V2 mod done but YES it should unless someone has another reason it shouldn’t. Hold the MENU button until you get the TT screen and it will show you your firmware version and if the V2 mod is confirmed

My understanding is that the new firmware WILL work with the rigs lacking the V2 mod. All you lose is the revisions to the Sweep feature provided by the hardware mod.

One of the V3 Beta Testers should hop in here at some point with a firm answer.

7682. S meter not at zero

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-04 10:53:01 UTC
From: fee@sfu.ca
Topic: 7682 Message: 7682

Hi all.

I did a quick search for this but found nothing.

The S-meter on my Orion 565 doesn't sit at zero when there is no signal.

I've unplugged the antenna and also tried terminating it with a 50 ohm dummy load, it still sits at about 1.5 s units.

It did it when I was on v1.3xx and and still does it after the 3.025 flash.

Not the end of the world but odd.

Does anyone else have that problem ?

Thanks, cheers and 73....dave / VE7SGI.

Question on the RX 366, sorry if it's already been answered. Are the filters in the 566 interchangeable with those in the RX366. Can you use the RX366 as your main receiver and move over existing filters? Thanks, DAN K3XR

We found the problem, and have it resolved.
I would like to wait for about a week, collect inputs on any other issues found during that time, and make a public release then.

Thanks for bringing this to our attention, we'll resolve 'em if we can reproduce 'em.

Thanks,
John Henry

7684. ORION 565 v 3.025 bug (strange screen garbage)

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-04 17:28:23 UTC
From: Martin
Topic: 7658 Message: 7684

Just got a strange garbage on the screen using tlf contesting software for linux (https://github.com/Tlf/tlf).

The radio is controlled with hamlib.
All the software is open source, also the communication radio <-> computer can be easily tracked down. Apparently the display shows parts of this communication.

See the pics
http://www.ok1rr.com/public/orion-bug1.jpg

and the detail
http://www.ok1rr.com/public/orion-bug2.jpg

Switching off/on clears the screen (returns to usual display), after a minute or two the garbage appears again. My usual logger is CQRLOG for linux which employs the same hamlb and no garbage screen. Initially, the garbage contains frq control sequences like @AF21026148 or so.

Windoze software not tested.

7685. All serial ports not created equal

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-04 17:35:18 UTC
From: floydsense
Topic: 7685 Message: 7685

Recently I reported a problem trying to apply the V3 update to my Orion II via a real serial port. While several other programs, including Onno's Serial Port Testing program, ran just fine on the port the V3 update program reported a failure at the start each time.

After much experimentation, I find that I can run the update just fine using the serial port on my Intel motherboard. But, none of the four serial ports on two PCI cards will allow the update to run. Exactly what's happening is unclear since Update doesn't provide any details on the error it encountered. But, there's clearly something in the add-on serial port hardware or drivers (yes - they're up to date) that causes the problem. These cards have a chipset from MosChip Semiconductor Technologies and were inexpensive cards from Newegg.

So, if you are having a problem doing the update via a real serial port and you're using an add-on serial port card, you might want to try the serial port on the motherboard, if you have one. Otherwise, I've found that I can do the update with no problem using a Prolific USB/Serial converter from this Win 7 system. There are apparently other converter cables that work as well.

Hi,

Do you know the polling time, command intergap time as well which commands are send to the orion? We are investigating the challenge and ypour help is much appreciated! Best regards, onno

It has poll rate 500 -> the radio is polled two times per second.

7689. Ham Radio Delux set up for PSK-31

Yahoo group: orion565 (2009 — 2013)

From: donkn5i
Topic: 7689 Message: 7689

Does anyone know why when in transmit PSK-31 with Ham Radio Delux all I send is a carrier. I receive ok. Radio keys up and shows watts out on watt meter, but only sends a straight line carrier. Also does this on MT-63. The e-mail is still good, but the new call is: W5DAM. If anyone knows what settings to use I would appreciate help. I am using a buscomm interface through the sound card.

Does the garbage appear on the screen after you tune the radio, especially if you tune quickly, or does it just appear randomly even when you are not tuning?

7692. RX366 panadpter interface

Yahoo group: orion565 (2009 — 2013)

From: objectiveuser
Topic: 7692 Message: 7692

My RX366 arrived via USPS this Saturday afternoon - installed it and it seems to work FB!

I need info about which TMP jack on the RX366 board is the IF out for the panadapter - I plan on using the SPARE RCA jack on the back of my Orion 565 - I have a TMP cable ready to go - just need the ID of the jack on the RX366 board and confirm that the empty TMP jack on back panel is the connection to the SPARE RCA jack.

I have my LP-PAN and N4PY and PowerSDR-IF software ready to go.

Hello,

I would be interested in purchasing some optional filters for the Orion II. Let me know what you might have available 1.8 kHz (model 2000), 600 Hz (model 2001), or 300 Hz (model 2002).

I work mostly SSB and the data modes.

Thanks

Ed W3ETC

Hi Terry,
Glad your RX366 arrived safely!!! Mine are due here in Montana on Tuesday. I was wondering if you could do me a favor with your rx366. Could you listen down in the AM broadcast band and see if you can listen to any AM stations. I was just wondering how well it would work as an auxiliary receiver for am country music and the like. If you could listen and let me know, I would sure appreciate it!!

Hi Floyd -

I knew when I read your original post that the problem was on the computer side, not the Orion but I didn't post a reply then. My apologies. I'll try not to make this a novel length but it helps to relate a somewhat similar issue in a different field.

Serial port issues can drive you crazy.

Years ago I received a call from a customer who installed one of my companies software products to interface to an platesetter. These are basically overgrown, expensive laser printers that etch text and images into metal plates that are then placed on a printing press.

In this case there were two cable interconnects between the computer and 'setter; a parallel 29160 SCSI data interface and a common serial control and machine status interface. The customer already had one 'setter running on another computer perfectly. This second 'setter/cables/computer were 100% identical except for two things. They had a terminal-workstation connected to the serial port on the motherboard and the serial cable for the 'setter was connected to an add-in multiport PCI card.

The troubleshooting over the telephone began with customer asuring me both systems hardware and software were identical. This 2nd system however, sometimes worked ok on smaller imaging jobs but consistently failed to complete larger jobs. While on the telephone I had them switch SCSI and serial cables to the other computer and the 2nd 'setter completed larger work without issue. Switching cables back to #2 computer, things failed again. I was pretty sure the issue was incomplete serial status information from the 'setter which would cause the SCSI data flow to hang. Somewhere about now I connected into this 2nd system remotely over the Internet and at first I found nothing askew in software and hardware configuration. And then I noticed the COM port assignment was not what I expected and that led to me finding a PCI device reporting it's presence which this particular COM port was assigned too. AH HAH! I think about this point the customer told me about a terminal was connected to this computer running hyperterminal program and the 'setters serial cable had been plugged into a port on the add-in PCI card. Hey, a serial port is a serial port, right? Well..... Here's where we toss in "it depends" and things get complicated.

From prior experience, I knew that this configuration demanded that the serial port needed to maintain constant-contact with the 'setter machine. As the SCSI 29160 parallel interface was pushing large amounts of data over to a laser imaging machine running something like 2,400 dots per inch to image onto plates that were about 30 inches in size, the plate position and imaging data completed needed to identify back to the computer constantly it's present state. Laser imaged plates can NOT have the laser stop "burning" the plate even for a second, otherwise the plate will have anomolies in the etched image at best and at worst, the imaging will stop completely, wasting expensive plates and the lasers in these buggers are not cheap either. The add-in PCI card would have a single "IRQ" (Interrupt) servicing 4 ports or whatever the card was and at a different priority than the motherboard port set for COM1. Masking and other things come into play with the interrupt request on how you get

multiple ports on a card to get the data through the right port connector. Anyway...

It gets deep to pick this apart as to why only one device on a port on this multi-port card didn't get serviced like the motherboard port but from experience, I was sure the issue would be solved by moving the cable over to the motherboard port assigned as COM1, and of course changing the soft port assignment so that the imaging software used that port. Instant, solid success with that change. And the terminal was connected to the multi-port PCI card and it also worked perfectly. I think that terminal had a higher bit per second configuration but buffering data and I am sure a lower overall demand on the actual serial text data flow was a-ok for it.

Now I could have done some other things that would have gotten the card to work with the 'setters needs just peachy. PCI slot change for the card and/or a different COM port-group-soft-assignment and I could have worked this out but I took the easy path that I knew would work straight away.

USB ports on a computer can be fussier. Most of us have more than a few ports and likely a few USB devices plugged into them. If two or more of these are concurrently active devices, the computers cpu can be getting nagged a lot to service requests from USB ports. Someone else indicated they unplugged all USB devices when they did their firmware updates. That actually may be providing him a better lock on cpu-attention to the IRQ request for his firmware update. Depends if the update flags an interrupt and maintains it, or drops it and then asks for it again--if another port already got the cpu paying attention to it's IRQ, then the firmware update might time out if it isn't getting serviced in a timely fashion.

I can shoot holes in my own story but to paint the entire picture of what takes place would make this dreadfully long(er). I think the point is that it helps to get the computer focused on some tasks that demand more constant attention. And that is regardless of the computers touted performance. We do not want the data stream of a firmware update, especially larger firmware data sets to fail to complete. For some devices this can turn into a real mess but at the very least, frustrating. Other devices and their lower soft-data demands on legacy or usb type serial ports will not likely hiccup with a momentary stall in being serviced.

Martin,

Good luck in contest.

Possible root causes are identified and tentec development is looking into it. Last contact with john was few hours ago and no stone is left unturned.

Lets hope the strange screen garbage can be solved quickly.

Best regards, onno

From: Fred lajoie
Topic: 7682 Message: 7698

Downloaded the new firmware with no problems but did find a few problems
1. On CW when receiving strong signals there is a loud popping noise as the signal approaches 50 to 60 DB
2. When trying to zero beat a CW signal, there is again a loud popping noise.
3. The signal on the band activity screen shows the station down 1.5KW from the actual frequency I am receiving him on. Tried it on 80m, 15m, 20m and 10m with the same results.

Gene - many thanks for speaking up! I understand everything you wrote and now believe that is the core of this issue. I just read through the Intel manual for my motherboard and looked at the IRQ assignments on my system. The motherboard Com port uses IRQ 4, which is UNSHARED. I have two PCI boards with 2 com ports each and in both cases there is a single IRQ for the two ports and that IRQ is shared with other devices in the system. I had thought I'd play around with the IRQ assignments, and while Windows 7 allows me to change the IRQ for the com port on the motherboard, it doesn't allow doing that for the PCI board com ports.

I read through a lot of forum posts on the subject of IRQs for Windows 7 and found multiple places where the Microsoft rep announced that IRQ sharing no longer has any importance and he proceeded to point to the motherboard as the problem. I read that as: "We have no idea what the problem is, but we think we can get away with blaming one of the other vendors and you'll go away."

One oddity of this problem that steered me away from a possible IRQ problem is that the failure is 100% solid and reproducible, and that it occurs at the very beginning of the communications between the Update program and the Orion. I say that because Update doesn't even get to the point where it's processing statement #1 in the update. But, other software such as Onno's Serial Port Testing program (in the files section here) works successfully 100% of the time using the same hardware and com port. Often, serial port related problems show up more with the higher speeds and it would be nice if the Orion allowed you to set a lower speed on the CAT port, but that's not an option.

So, I'd say this problem is very much dependent on individual motherboards and hardware and operating system and if someone encounters it, he should try a com port on the motherboard and see if that solves it.

Some current motherboards (mine is an Intel) complicate things by placing the serial port header far away from the backpanel card area and the manufacturer doesn't even supply a header cable to get to the backpanel. The normal 11 or 12 inch cable and connector will reach only if you do a bit of stretching.

Hopefully, my next motherboard will still have a serial port on it.

Terry -

I am very interested in doing the same thing. I would like to know if the PowerSDR-IF panadapter display shows a flat response. I have been using the buffer amplifier IF tap described by VE7TK. There is a 10db dip in the output near the center frequency and I am hoping that the RX366 doesn't have that issue. Also, using the tap results in a total bandwidth of about 120khz. I am hoping the RX366 will allow a bandwidth of 192khz.

I'm eager to hear your experience with the RX366.

Turn on the hardware noise blanker, and watch the dip disappear.

Only if you want to lose your dynamic range. In a contest, DXing, or on
160m that's a poor option.

Of course. But, there are also instances where you'll see things that otherwise might escape notice. For example, a signal down in the mud on an otherwise quiet 6M band. Very useful when using a 6M transverter. In the other situations you mentioned, the dip is often not even noticeable. But, wouldn't it be nice if the dip weren't there in the first place.

Hello

I have an Orion 1 with the 762 filter in the 1000 hz slot, the 1000 hz filter in the 1.8 slot, and the INRAD 760 250hz in the 250 hz slot. 500 hz is empty.

It had V1.37 installed, so I successfully (!) performed the logic board mod and upgraded the software to the 3.025 and all is working well with the rig. I have a couple of questions:

1. Do I need the 250 hz filter? I've read various opinions about this. I operate a lot of CW.

2. Should I buy a 1.8 khz filter for the 1.8 slot?

3. How do I use the 600 hz 762 filter effectively?

I'm still getting used to everything on the radio - it works great and has a lot of tools for the engineeringish ham!

Any insights would be very much appreciated. 73s de KT8DX

I concur. Very nice AM BC reception. At first I thought it was poor, then
I realized I was listening on my TH-11.
Switched over to my 160 antenna and VIOLA! Great AM BC...country music, as
well.

Very nice.

No, the 762 is all you need for CW

> 2. Should I buy a 1.8 khz filter for the 1.8 slot?
>

Yes, if you operate SSB contests; otherwise it probably won't be needed

>
> 3. How do I use the 600 hz 762 filter effectively?
>
>
Go into Menu - Filtr. Just make sure Xtal Filter is set to Auto and Enable
500 Hz and Enable 250 Hz are set to No. The 762 will be automatically
selected whenever your bandwidth is 1000hz or below. There's nothing else
for you to do. Just dial in whatever dsp selectivity you want with BW.

I operated in the toughest conditions for years in contests and on topband
with my Orion and 762 filter and I never felt that I needed a narrower
roofing filter.

7707. RX366 Orion 1 and V3.025

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-05 18:39:01 UTC
From: objectiveuser
Topic: 7707 Message: 7707

WIth the RX366 subreceiver installed and V3.025 firmware, when I try to enter 1.070 MHz into
VFO B which is asssigned to the subreceiver, I get a Frequency Not Supported message on the LCD.
On my other Orion with the original subreceiver, the same keystrokes give me the local AM station
using v1.372 (my gold standard for dx AM operation).

On the right hand side of the LCD display where the graphics show the receive bandwidth, there is an overbar down from wide open down to 710 Hz; from 700 Hz down, the overbar (which shows the roofing filter selected on the main receiver) disappears. I have installed and
selected the 600Hz filter in slot 2; the stock 2.4kHz filter is selected in slot 1.

Oops - In addition to selecting the sub rx for VFO B, I had VFO B
selected for the transmitter (because I had been operating split) -
when I put the TX back on VFO A the RX366 hears FB on the BCB.

The note about the overbar on the bandwidth symbol still stands.

7710. Current Status of 566 V3 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-05 23:15:30 UTC
From: John
Topic: 7710 Message: 7710

So far, the 566 V3 firmware has been a huge success. Of course, I did expect that the broader group would find something that we missed.

We have resolved the current HW Mic gain issue seen in the Orion 566v3.026 firmware
The new build 566v3.027 is in the hands of the beta testers, and a few of the original problem reporters on the tentec contesting reflector. 566v3.027.

If there are other issues that I have missed on this and other reflectors that are critical for your operations, then please email them directly to me at jhenry at tentec.com
To help me sort them, please ensure you have 566v3.026 bug xxxx in the title. Easier for me to sort and not miss due to the amount of inquiries we are getting and the amount of positive feedback we are getting on the 566 V3 release. It is a winner, and it will only get better.

If I hear of no other issues with our current production 566 firmware, then once acceptance testing passes, and I have positive inputs from the beta test team, I will release it as a new release to the general public.

Best Regards,
John Henry
TenTec Engineering

7711. Current Status of 565 V3 firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-05 23:53:32 UTC
From: John
Topic: 7711 Message: 7711

As in the 566, the 565v3.025 firmware has also been a huge success.

We are looking at the main issues that users have reported, and have been able to reproduce most of them.
Various screen gibberish characters related to CAT program / Logging. The beta testers spent endless hours Friday/Saturday and they were the ones that actually narrowed down the sequences required to repeat these issues at almost 100% rate now. My hats off to them for working so hard on this, to find ways to reproduce the issues seen by NQ4I and others. We can now reproduce them at TenTec, and it is just a matter of time before we lick the biggest display issue in 565. Please be patient, and stay tuned.

There are a couple of other items we will look at, in a build very soon, including:
A record / replay issue.
A Vox SSB issue.
And a few others.
I can reproduce these, and others, and will try to address them in a release before the end of the week to the beta test team, and hopefully to the world. All depends upon how long it takes to resolve them, and then the time for the beta team to now say that everything is OK with them as well.

If there are other issues that I have missed on this and other reflectors that are critical for your operations, then please email them directly to me at
jhenry at tentec.com
To help me sort them, please ensure you have 565v3.025 bug xxxx in the title.
Easier for me to sort and not miss due to the amount of inquiries we are getting and the amount of positive feedback we are getting on the 565 V3 release. It is a winner, and it will only get better.

To: orion565@yahoogroups.com
Subject: [orion565] V3 update not successful yet

After loading the new version 3.025 firmware into my 565, doing a master reset and clearing the memories, the radio lights up as it should but stops one step short of going operational. The screen displays the normal TT logo, Version number, date, time, DSP version and goes no further. I have repeated the process with same results. I am upgrading from 2.064x11.

I do not have the RX=366 installed and therefore I select "NO" when asked.

I am going to start all over and download the file again and try again. Any other suggestions?

Tnx, Art N4UC

Art,

I would also like to suggest going to device manager and look at the ports listed. One should be the USB/Serial adapter you are using. Look at the properties to find what chip set is used in the adapter. I have Prolific in mine. When I had trouble with my adapter, I found that there was a newer driver for the chip set.

7718. Possible bug??

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-06 22:01:53 UTC
From: Larry Menzel
Topic: 7718 Message: 7718

Hi, guys, John,

I am accustomed to being able to listen on my headphones with both rx in my ears and the SUB in my right ear only.

To do this in previous software, I selected AUDIO/ Left as MAIN and Right as SUB. There used to be a small headphone indicator on the screen with both ears on the main rx, and just the right on the SUB.

I've tried every iteration, but can't get the icons right nor can I get audio for both ears for the main rx. No selection yield audio in both ears with the sub-receiver volume turned all the way down as in the past.

Anyone else finding this?

Larry, W0PR

PS...same on both the 565 and 566.

Larry, my 565 can do exactly what you describe with audio and icons correct.

Well, I cannot, Barry. When I select MAIN and SUB all I get is Main audio on the left and sub on the right.

I can't get the double little earphone icon in the usual MAIN position, just a "left" earphone icon.

Can't get audio in both ears with the SUB RX turned all the way down or muted.

From: Larry Menzel
Topic: 7718 Message: 7721

Furthermore, if I select SUB/BOTH I get no audio in my left ear, only SUB in my right.

Here's a chart of what I hear:

Left Main Right Sub: Audio: If I mute the Sub, I get main audio in my left ear only, nothing in the right. Icons: Main left ear Sub right ear
Left Both Right Sub: Audio: Same as above Icons: Main left only, Sub both
Left Sub Right Sub: Audio: Sub in both ears Icons: Main, none Sub: both
Left Main Right Main: Audio: Main audio in both ears, Sub none Icons: Main both, Sub none
Left Main Right Both: Audio: Main only on left Sub only Icons: Main both Sub left
Left Main Right Sub: Audio Main only on left Sub: sub only Icons: Main left Sub right

Under no circumstance to I get main audio in both ears. I will reload a previous level in my 565 and see what happens.

This is definitely not right.

If you go into Audio Menu, does Left say "Main" and Right say "Both"?

Yes. I guess that's one iteration I didn't try.

Operator error as usual.

Thanks. Barry

It is a cosmetic bug issue with no other side efects.

If RIT on, the SAF label is not fully rendered. Switching the RIT off
and selecting the menus (-< the display changes), then returning to the
normal display, the SAF is fully rendered.

FYI, my Kenwood TS-940 (and many others) are required to be in VOX mode in order to key the transmitter in CW. Otherwise all you get is the sidetone with no RF, which is a feature that I wish my Orion had.

Subject: [orion565] Re: Question on VOX button effect on V3

There is no reason for VOX on for CW on the Orion. But, why should I have to turn it off for CW if I was just operating SSB? None of the other dozens of transceivers I've owned have required that.

I operate very little SSB, so didn't know if it operated the same way on 2.044. Since you say it does, then I guess that's just the way it is and not related to V3. Thanks for the info.

Fair question. I guess the best case would be that the vox function should be disabled in cw mode.

Not a programmer, but I guess it wouldn't be that difficult to do. John watches the reflector for bugs these days, so maybe he'll see this one.

I recall that it worked that way in 2.062. I just turned off the vox and never gave it a thought.

7727. No sub-receiver after 3.025 upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-07 02:17:46 UTC
From: Larry Menzel
Topic: 7727 Message: 7727

OK, boys, here's one for you. Orion 565

I've tried reflashing my radio repeatedly and it doesn't change anything.

After my 3.025 upgrade, my VFo B, (second receiver) is not working. Just white noise on all bands, all modes.

I had reason to reinstall a previous version, 2.062 I believe, and came back to 3.025 this evening. Worked fine after my initial upgrade but something is not working now.

VFO A works perfectly, as usual. VFO B transmits (can't tell the quality of it) but all I get is noise when I turn up the volume.

Anybody else experiencing this? Could I have damaged something in the process of getting the flash ROM to update. I had a couple of false starts. The last one, 3.025 began with erasing the ROM and then installed just fine.

Stumped.

Larry, W0PR

Hi Larry,

I've been switching between a number of firmware versions a bit here, and I had that problem once. In the "Audio" menu, "Left", "Right" and "Spkr" had all changed to "Main". Once I switched them to "Both", everything returned to normal.

Maybe that's what happened to you. Good Luck!

I have managed to line up the sub receiver with the main by audibly removing the pulsating beat tone using CW mode and a steady carrier. I can never seem to make it fully zero, however, I find the beat tone audibly cycle from silence to peak tone back to silence in ~45 seconds duration. Does this sound like I have properly zeroed my receivers or am I way off?

When I am in SSB mode with VOX enabled and change the mode to CW the VOX turns off. When I go back to SSB the VOX comes back on. While in CW mode and then enable VOX it mutes the RX audio.

HI, Mike,

No, that doesn't do it. The S/N is so low and the noise so high that it's unusable. I'll try reloading the software today, after I call Ten Tec and see if they have any suggestions.

Thanks.

I would re-flash (followed with RAM CLEAR) and see if your subreceiver
doesn't come back, before calling Ten-Tec.

And when initially testing, connect the SAME antenna to main and subrx and set audio for main in L and sub in R and check for same response in both ears.

Good morning, Barry,

I'm going to revert again to 2.062 and see if the rx returns. I just spoke with Paul Clinton and he doesn't think it's the firmware. However, I really don't believe in coincidences so I'm not convinced that they're not in some way connected.

Additionally, because I upgraded the rx in my OII, I have a receiver board here to swap in to see if it's a hardware problem with the rx or whether the problem is deeper in the radio.

So....stand by...more to come.

Knock yourself out Larry but I'd just re-flash with 3.025. It's only a
5-minute process start to finish.

Well...OK...I did reload 2.062 this morning,and lo and behold...my receiver comes to life.

So, we have established that there is nothing wrong with the Orion. So now I'll try reloading 3.025 again, or maybe not....seeing as how my Orion is my second radio and works fine with 2.062. I think I'll wait until John and all the beta testers get done fixing the little glitches and we et 3.025A out there, and then upgrade again and see what happens.

My Orion II, with the new RX-366, is nothing but spectacular now and is my main rig for operating. My Orion is my S&P rig for contesting and rag chewing while I prowl the bands for DX with the OII.

Sounds like a plan, especially as now I have a perfectly functional Orion sitting here.

7741. Re: No sub-receiver after 3.025 upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-07 20:24:45 UTC
From: airman11141952
Topic: 7727 Message: 7741

Greetings! I've been around this group for a few years, but pretty much just in lurking mode. I did upgrade my 565 to 3.025, but still have the original 2nd receiver. I have not had any of the issues that a few others have had after the upgrade. I believe it is computer specific issues that some folk have with it. I could not tell you what they are -- just a gut feeling. I just happen to use an Intel I7-950 computer with Windows 7 Pro, 64 bit, with a PCI card with four RS232 ports. Not one issue. Used this same computer when I upgraded to 2.062. Definitely like the changes, so far, to my Orion. Still tossing around in my head on pulling the trigger on the new second receiver. Fascinated with the performance of the current hardware setup. Maybe later.

Thank you Ten-Tec.

Thanks for reading my jibberish (sp),
Gary W7TRP

My appologies for inconvenience but I have removed the previous beta versions to avoid conflicts and issues. I have a new version ready to be shared this weekend (travelling at the moment) which includes help text and some other improvements.

Also created a special windows xp installer for the ones experiencing microsoft installer issues.

Best regards, onno

7745. Orion 565 no power output on startup

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-08 15:55:59 UTC
From: Russ
Topic: 7745 Message: 7745

When I initially power up my 565 after being off for a few hours there is no RF power output in any mode. The output meter shows normal values and the red led is on, and there is the normal indicated power increase when pressing PWR after having pressed TUNE but no actual power output.

Through experimentation I have discovered that normal RF output will return if I either turn the 565 off and on again, or if I change bands. It doesn't matter which band is the initial band nor which I switch to.

This problem began a few weeks ago under v2. I've since installed v3 and done all the ram and master resets. As a first step I replaced the battery which didn't help. I've reloaded v3 to no effect. I've switched antenna ports from one to two with no effect.

I cannot detect any other unusual operation to further localize the problem. I have checked the DC power connector and it is good. The antenna is good.

Suggestions anybody? Thanks for your help.

73, Russ

I have experianced the same from static discharge when turnning on the Radio but know the reason from the snap as I discharge the build up, I'm saying from me to Radio, could be Radio to me, touching the Radio before or upon turn on will eliminate my problem, only happens during winter when dry air is the norm.

During this time, is the receiver working OK (do you hear signals)?

Yes, receives fine, either antenna input.

Yes, changing to any mode had no effect on power output including FSK mode. What I discovered tonight while doing more investigation was that pressing ATTN would return power output to normal and at the same time allow me to hear signals instead of just band noise. I had thought the band was dead because other times with no output the receiver still functioned normally, so tonight was a change in that respect.

7752. RX366 Noticable filter difference - Main vs. Sub??

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-09 12:37:38 UTC
From: w1nt
Topic: 7752 Message: 7752

I am audibly noticing a large sound level difference between 300 Hz roofing filters on the main vs sub RX when running diversity. With these settings common (same settings) between both receivers (Antenna, AGC, RF GAIN, ATT, PREAMP, BW, PBT, ROOFING FILTER) the sub filter produces noticably quieter audio to the point where it makes weak signals that can be heard on the main almost not or not audible on the sub when listened to in different ears. Is anyone else able to replicate this?

I am just wondering if this is normal for the RX366 or is it due to the inability to center the sub roofing filter with the DSP or is it just variation between filters as produced?

It's so noticeable I am now going to load the 600Hz filter in the sub to see if I get the same result. Any help or guidance is appreciated.

Brad

I think it's normal to see a bit of gain difference between the receivers.
It should be easy for you to accommodate the difference by just dialing in
a bit more AF or RF Gain in the subrx.

In my Orion I, it's actually the opposite - the RX366 has more gain than
the main rx. All I need to do is run the subrx AF Gain about 10-15% less
than the main rx and all is well.

I just finished intalling the RX-366 subreceiver upgrade and am trying to load the required 565 V3.025 firmware. I am first initiating the flash update mode. When I attempt to load the firmware, after a few seconds I get the message "Communication with the radio has failed." I have all other programs shut down.

Bummer!

Can anyone help?

73,
Charles - KY4P

Charles,
That happened to me as well. So, I changed the com port in the settings to "3" and it worked. Good luck.

Troy,

Thanks.

My computer has only one serial port. When I select anything other than #1 I get a message that says that port is not available.

7757. SAF Feature (bug or perhaps just left out in the documents)

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-10 08:30:46 UTC
From: Sam
Topic: 7757 Message: 7757

To quote the updated document for V3 concerning SAF, it says:

SAF can greatly improve readability of weaker ssb and am signals. The SAF width should be
set to 300hz. Tune in the signal and engage SAF. Adjust the center frequency for best
readability, usually in the range of 300-600hz.

Following these instructions and just playing around with the SAF feature, I can't see any difference with the SAF feature turned on or off. It's as if it's not even there.

I'm using the O2, V3 installed, No R366 (standard 2nd receiver). SAF appears below the "headphone symbol" and is turned on in the RX menu.

==========
NOTE: I was just getting ready to send this, and I happened to "turn off" my AN Feature (which I always keep on to kill the tune-up carrier noise) and immediately the SAF kicked in !! WTF? Is this a bug as I didn't see anywhere where it says the AN (Auto-Notch) has to be disabled for the SAF to work ???
==========

73,
Sam

Is it possible to have a basic configuration for an ORION 566 RX menu:
MAIN AGC. SUB MCO. NOTCH AND SUB MAIN up. We can then customize the desired result, just a working basis. Thank you.

Est ce qu'il est possible d'avoir une configuration de base pour un ORION 566 menu RX:
MAIN AGC. SUB AGC. Jusqu'à NOTCH MAIN ET SUB. On pourra ensuite personnaliser selon le résultat voulu, simplement une base de travail. Merci.

Sam - I just tried this on my O2, V3, no R366. It works exactly the same here as you described.

I have installed the new firmware, do not have the new subreceiver, and the SAV function works great on weak signals. YOu might try reinstalling the firmware.

Try using the SAF in SSB mode with the AN turned on. Cycle the AN on and off and see what happens.

Auto Notch and SAF are mutually exclusive. What are the odds that you would even want to run them both at the same time?

Guess it depends on personal preference - I could probably count on one hand the number of times I've used a notch filter in the past 5 years. (which is actually greater than the number of times I've used DSP NR in the past 5 years)

Barry perhaps you are not subject to interfering carriers, noise,
Broadcast carriers, splatter from over modulated audio, etc. I may
have any of those every day.

For me, the odds would be ZERO. But, as an old programmer, I would never have created a situation where you could initiate two mutually exclusive actions, as you can in this situation. There are a few good reasons for that position and one of them is that it will, in the long run, create unnecessary calls to the Tentec service department. That might me minimized by a comment in the documentation explaining that the two functions are mutually exclusive as the original poster mentioned.

It turned out that the problem was with the serial cable I borrowed from a friend. The CTS connection was missing. I made up a correct cable with some DB-9's I had on hand. The load was successful with the new cable.

Why ? It works great, just NOT with the AN feature turned on. If that is by design, they left it out in all the documentation. So it's either a BUG in the software or an omission in the documentation.

I have. With the AN on, the SAF stops working, turn off the AN and the SAF works again. Try the W: 200 Hz and the C: 90 Hz. Cuts out all the "hiss" on 40 meters, allows nice audio to come through (but not with the AN on).

Floyd,
If you do any amount of SSB you will find that hams still do not know how to tune up. They move off the frequency they want to use by about 500Hz to 1k Hz and key down their 1,500 W Legal Limit amplifier for 10 to 15 minutes. Geesh. The AN (auto notch) feature removes the loud hetrodyne 1K tone that is generated by the O2 due to the LID's operating practices.

So as a rule, I keep the AN on all the time. As far as the DSP NR, I would use it if it worked. Seems V3 has made the NR feature work a bit better.

7773. Re: RX366 Noticable filter difference - Main vs. Sub??

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-11 01:00:35 UTC
From: w1nt
Topic: 7752 Message: 7773

Gain difference I can see clearly because I am needing to adjust the RF Gain differently between MAIN and SUB. What I have been doing is adjusting MAIN and SUB for equal band noise and then operating from there. The observation with doing that, however, is always a much quieter CW signal on the SUB 300Hz filter than the MAIN which is noticeable to the point on weak signal work that the SUB sometimes never hears a signal (recall this testing is being done on same antenna to eliminate that variable). Fiddling with RF gain and AF gain on the sub to bring the received signal audio level to match just worsens the noise - an undesirable result with louder noise in one ear as compared to the other.

Now, using the 300HZ on the main and the 600Hz in the sub produces what I would call the "closest sound". Both band noise levels are equivalent and the received signal levels are as well. So maybe a 300Hz filter problem or something else? For now, the best results where main and sub match up the best are 300Hz main, 600Hz sub and all DSP filter values 300 or less match up the received signal perfectly.

Thoughts?

Tune in an s9+ carrier, e.g. 40M SW broadcast, with same antenna feeding main and sub rx. Turn preamp on, ATT off, RF Gain max - in both receivers. Turn up the AF Gain in each receiver to a very loud, but not uncomfortable level - with matching loud levels in both receivers. Note the AF Gain levels in each receiver - use that AF Gain setting, essentially all the time - don't touch it. For normal operation, just back the RF Gain way down till you just hear band noise in each receiver.

If you want to test that SUB 300hz filter - just do the above AF Gain setting/matching at a wide bandwidth and then narrow the bandwidth down and see if the level in main and subrx stays matched as each successively narrow filter kicks in.

Hello Martin,

A new firmware version is created and tested within the beta group. So far it seems the display errors are resolved. Now we just have to wait for ten tec to release a new version.
best regards, onno

7777. FW V3.026: Minor bug report - Sweep display freezing

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-11 11:36:43 UTC
From: Peter Frenning [OZ1PIF]
Topic: 7777 Message: 7777

If left alone for a considerable time (but usually less than an hour) in
Rx mode with Sweep on, it'll sometimes freeze (this also happened,
albeit more often with earlier FW).
A quick off/on of the Sweep button, will restart the Sweep display.

7780. Orion Backup and restore V2930 available for download

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-11 16:44:31 UTC
From: pa1ap
Topic: 7780 Message: 7780

Greetings,

I am happy to inform you that OBR 2930 is now available.

The program includes a lightweight help function. Click on ? and point with mouse to area of interest. A small popup window will provide some information. For remaining questions send me an email.

Obviously it is recommended to leave the Orion untouched during the backup or restore procedure ;-) During backup and restore both VFO's will be locked and (un)lock will be recovered afterwards. Same for frequency and mode where applicable.

Hope you will enjoy the program and that it will be of benefit for you.

Some background on the backup and restore function;

1) I cannot perform a backup of values which are not covered by a serial command. At present OBR includes all commands available except for the Tuner on/off status...

2) You can click on the "translate" button to rotate to different log views. This button will not change what is stored in the backup file and it is just there for curious people ;-) The translate+ button provides some hints of where you would normally find the value which is included in the backup or restore sequence.

Recommended installation package:

OBR setup 2920.zip for all windows versions (4.5 installer)
http://www.box.com/s/4r7y8g39avyypbmju7ml

In case the recommended does not work on your windows xp environment:

OBR setup 2920 XP special.zip for windows XP (3.1 installer)
http://www.box.com/s/rg37a1222duhr2xdgy93

Best regards,
Onno

7781. Anybody using Beyerdynamic DT-109 headset with Orion?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-11 17:26:34 UTC
From: Barry N1EU
Topic: 7781 Message: 7781

If anybody out there is using a Beyerdynamic DT-109 headset with the Orion, could you please drop me an email? I'd like to discuss headphone and mic levels. One thing I'm finding is that with Orion (v3) AF Gain at 100%, headphone volume level is barely adequate. Headphone impedance is 50 ohms. My K3 drives the headphones without a problem.

Thanks & 73,
Barry N1EU

A special note for windows xp users might be of use: please ensure you run windows update process (all and not only urgent ones) prior to installing the obr utility. The utility expects certain environment to be there and if your windows xp has been catching dust for a while it will not have the latest environment.

Best regards, onno

7786. Re: RX366 Noticable filter difference - Main vs. Sub??

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-12 21:15:42 UTC
From: w1nt
Topic: 7752 Message: 7786

Slightly unmatched when 300main & 300sub IMO.

300main,600sub - good match-up. @11.8 sec switch to 300Hz, 13.8 sec back to 600Hz, 15.1 seconds back to 300Hz:
http://www.w1nt.com/sounds/RX366/300main_600sub.mp3

300 main, 300 sub - slight mismatch. slience between 11-13 seconds i switch over to 300Hz filter.
http://www.w1nt.com/sounds/RX366/300main_300sub.mp3

300 main, 300 sub - 1uV signal, sub RX almost disappears.
http://www.w1nt.com/sounds/RX366/300main_300sub_1uv.mp3

7787. v 3.025 on my 565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-13 05:44:13 UTC
From: Larry Menzel
Topic: 7787 Message: 7787

Guys,

I'm having a duece of a time with my second receiver on my 565. Since I loaded 3.025 it's intermittent. Sometime when I turn it up, it's there and sometimes it's not.

I reinstalled 2.062a and the receiver works perfectly, so I guess, at least in my case, it's something to do with the firmware and my radio.

I have done the switch between version twice now, and each time, 2.062a works fine, and 3.025 does not. When it's not working it's just white noise, no matter how high I turn the gain, there's no signal there. I love the SAF feature, and sure want to run 3.025 on my radio, but maybe I'll have to go back so i have both receivers working.

Anyone else experiencing this?

Larry, W0PR

Larry, Are you doing the ram reset and the master reset after
you install the new firmware.
also at the time of ram reset the question is asked if you have the new RX366 receiver
board if you answer YES that is the reason you
cant receive on the sub receiver, because that board is not installed.
go do another ram reset after you install the new firware and take
a good look at the questions asked.

Regards Alan - AK8S

Hi, Alan,

I wish it was true that I had "mispushed" the button, but I didn't. I followed all instructions to the letter, and answered NO to the installed rx question. So unless the firmware is lying to me (yes is no and no is yes!) then that's not the problem.

That does not explain why the receiver works at some times, and not at others. Just now, I was listening on 75 and the receiver was not working. I switched to 20 meters, and it started working! I switched back to 75 LSB and now it is working here as well.

See, not at all how it's supposed to work. Very strange.

Look on the Filter Menu. Do you see three slots listed on the bottom for
the RX366 subreceiver? If so, the firmware thinks you said "yes" to RX366
installation. If that's the case, perhaps the firmware isn't detecting the
"No" button press correctly.

Hi Barry,

Yes, the three slots are there, but all are reporting NONE as they should.
I suspect that 3.025 adds that filter selection menu regardless of whether
the receiver is installed or not.

Why it should work sometimes and not all the time is my problem. I'll call
Paul this morning and see what he has to say about it.

Thanks.

Barry,

I am looking at my menu and I do not have the RX366. I selected NO for the RX366 installed, yet the filter lists are at the bottom. They are set to NONE. I can change the value, but I kept it at NONE. I wonder if the Clear Memories and Clear filters option should be selected as NO and then reload what is actually installed.

73,

John

Hi, John,

I just got off the phone with Paul Clinton, and yes, those filter selections are inherent in the 3.025 firmware, even if you answer NO to the RX366 installed question.

They have no function without the receiver, naturally.

Sorry, I stand corrected but it was worth investigating. Don't understand why they didn't suppress those 3 lines but I'm sure there's a good reason.

When you boot your Orion, you don't see a message saying "RX366 Installed"
do you?

Did Paul Clinton have any troubleshooting advice?

7796. Orion 565 Battery Replacement with Photos

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-13 17:58:28 UTC
From: Russell Hamilton
Topic: 7796 Message: 7796

I just had to replace my 565 battery. In case you need to replace yours here's some helpful information and photos.

The yellow rectangle on the left of the inside front panel is the battery. Ten Tec said battery colors could vary so yours may be different.

I found it helpful to use an IC extractor to remove the old battery; the replacement battery snaps in with just a little pressure. Observe battery orientation prior to removal and insert the replacement accordingly.

My suggestion is to lay the rig on something soft, remove top and bottom covers, set the radio upside down, remove half the screws holding front panel. Then turn radio right side up and elevate the sides about ¾ inch to give room for the front panel to swing downward and outward. You do not want to move the radio after the front panel has been removed.

Then remove the remaining front panel screws and pull the front panel out carefully.

Observe the yellow battery on the left, it is not necessary to unplug any front panel connections.

Needless to say all your menu settings will be gone, so write them down before battery replacement as necessary.

Upon initial restart I had no audio output until I did a ram and master reset at least twice (possibly three times) before the radio would function normally. I nearly put my finger thru the speaker cone while turning the radio over so be careful handling the radio.

The battery cost was $9.00 plus $3.00 shipping, your mileage may vary, comes to about a dollar a year for memory retention.

Photos can be found in the "Battery Replacement for Orion 565" photo album.

Very timely information, as my replacement battery should arrive either tomorrow or Thursday.

Thanks a bunch!

Greetings,

Some minor changes to the program which might be of use;

1- additional validation of backup sequence
2- v3 error backup settings can now be restored into v2 orion. the restore function will skip the v3 specific objects and hence not send them to v2 orion.
3- included 5 seconds timeout in case communication fails.
4- tested with v2 and v3 latest beta code and all seems to work smooth

OBR setup 2951 standard.zip
https://www.box.net/shared/gqbhq9ytnu6k470vy4pl

OBR OBR OBR setup 2951 XP special.zip
https://www.box.net/shared/ud2rpm53de946z8ueotj

I had various responses on xp environment. Sometimes it works right away, sometimes one has to ensure windows update is completed prior to installation. I have created a new package using 4.x net and 3.1 installer which should make this a smooth ride too... please send me email hown it went?

Best regards, onno

PROBLEM SOLVED!

Turned out to be caused by a failing (but still operational) A9 card. Ten Tec said the Orion is very sensitive to ripple. Signs of A9 failure were one of three well-known capacitors having a slightly bulging top and being warm to the touch. Definitely a no-no according to Paul at Ten Tec. Had I not recently replaced the battery, it too would have been suspect, because at the point of failure Paul said it can cause similar events. My 565 was built in 2004, so the card provided about eight years of daily service, to offer an idea of how long your A9 may last.

Thank you Mike,

but I wasn't so lucky, hi.

I replace them (C6, C7, C9) with low ESR, 105dg and when I power up the rig display was dark and no audio. Measure the voltages: 13.8V present but no 5V (only 0.5V) and no -20V (-3V or something) so I suspect either LT1054CS8 is dead or maybe another capacitor or diode defective. Q4, Q5 are fine. Now I am looking for an LT1054CS8.

I wonder if anyone experience such behavior after capacitors replacement?

Not sure what they cost however for a few dollars you can repair it yourself. 98% of all failures are due to those 470uF caps. Just swap them out and plug back in.

Thank's Sam

caps replacement bring some weird behavior. No 5V (only 0.5V) and -3V instead of -20V. I guess LT1054CS8 is defective also.

I don't know if anyone experience such behavior after caps replacement.

All the best!

Are you sure you have mounted the capacitors with correct polarisation? It is easy mistake to make and might explain the problem you see.... best regards, onno

Ten Tec sells new A9 boards with upgraded caps for $51.18 USD plus shipping.

7813. 565 board pictures album

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-17 16:30:17 UTC
From: Martin Sole
Topic: 7813 Message: 7813

As our 565's get older, not that it's ever a problem being Ten Tec, the reality is of course that more issues may arise. Right now I am reworking a failed power connector on the A0 board and took the opportunity of taking a couple of pictures of the front and back of the board. Posted them to an album on the site page and hopefully if you have any to add you can put them in here in the hope we should in time have pictures of all Orion boards which might help with future trouble shooting (If only we could get the board layouts posted). No I'm not pulling the whole radio apart just to take pictures! I'm sure others have a picture or 2 to add here.

Album is under photos and named 565 boards.

Regards

Martin, HS0ZED

Great idea Martin!

I will mirror the photos on the Ten-Tec Wiki when i get a chance.

7815. Item for Firmware Update (3.027 or later)

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-17 17:47:12 UTC
From: gmday2
Topic: 7815 Message: 7815

Hi All,

I recall reading a message on the TenTec Wiki (http://tentecwiki.org/doku.php?id=565hilowcut) regarding a problem with the opertion of the HI CUT control not updating the PBT value on the display, according to Scott Robbins. Only the BW value changes. The PBT value does update properly with LO CUT, though. Here is the quote from the Wiki:

"The PBT and BW values are supposed to update on screen graphics and text - unfortunately compounding the confusion is a bug that is present when HI CUT is adjusted. LO CUT shows the adjustment of PBT and BW values simultaneously, while HI CUT only shows the BW update, not the PBT value. This needs to be corrected.

Scott Robbins, W4PA "

I know John Henry reads this Yahoo Group, so I am requesting that this correction be made in the firmware before it is released. It's not a problem with the actual operation or performance of the transceiver, but comes more under the screen display fixes, and I notice the V3.026 (and I presume 3.025 for the original Orion) still exhibit this (incorrect) issue.

Thanks & 73,

Greg

I just uploaded a few pics I took when I replaced the caps on the A9 board in July 2009. They are in the photos under <http://groups.yahoo.com/group/orion565/photos/album/1929925813/pic/list> KO4XJ A9 Board You can see the slight bulge in one of the caps and another pic show the new values and the size different in the caps that TT sent me.

It's an easy job.

From: John Hudson
Topic: 7817 Message: 7817

While I was uploading the A9 pictures I went ahead and upload the pictures I took when I replaced the Molex connector for the 12V power. It was the culprit that cause the rig to reboot when transmitting. The pins were loose and arched. I hardwired a power cord to the board and it's been fine since 2008

I have no official way of knowing, but this would seem to indicate that they have sold out of their present stock of the deluxe sub-receivers. I would imagine that as soon as they build and test more of the RX366 subreceivers, they will again post them for sale. Ten Tec is a very ethical, customer driven company and there is no doubt in my mind that this is how they would do business as opposed to the people who would not admit that an item was currently not available but would keep your credit card tied up anyway. My hat is off to the GREAT people of Ten Tec!!

Having sold out the first production run would be a poor reason for them to disappear off the web site. I suspect it is another reason, because a sure way to not sell something is to leave it off the web. I'm sure they would tell callers they are taking orders for the second run.

John - I just installed the beta level on my Orion II. Did the ram clear and reset. The first half of the S in SAF still disappears when I turn on RIT with the RIT button.

Hello Floyd,

I believe thats what john ment in the text you refer too.... the rit /saf display error is not resolved in 3027.

Tentec and beta team testing day and night the latest firmware and so far very good results.

Best regards, onno

OK. Guess I missed the embedded line that identified the last couple of fixes as in the 565 code only.

Art your comment on 5:00pm on a Friday is only half the story.

It is now 9:45am on Saturday morning here on the west coast. I awoke to find that John and Gary had posted the latest version for the Beta testers couple of hours ago! Yes on a Saturday morning!

The communication by Ten-Tec is excellent BUT the effort behind the scenes by Ten-Tec is also amazing.

7832. New 566

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-19 04:34:37 UTC
From: Marty Young
Topic: 7832 Message: 7832

Good evening everyone:

My new Orion II arrived here from TT this past Tuesday. I have a long way to go before I master its real strengths. But I have to tell you something you surely already know, this rig is nothing short of spectacular (using factory defaults)! I can only imagine what's in store once I have some stick time under my belt. I also got the RX366 receiver before they ran out of em. Just under the wire apparently!

Its hooked up to my temporary balanced feed-line multiband dipole right now. I have a KLM KT-34A(M2 retro-fit) and tower project in progress as we speak. Also a Wellbrook 1530 broadband RX loop is on the way. (No real estate for a beverage)

My only wrinkle is that I am going to need a new shack desk as this rig is BIG. I keep looking for the door on it to microwave my sandwich while I'm operating! HI!

Since V3 has already been released, how about releasing the V3 Beta (V3 with repairs) to the public. I can't see any negatives and on the positive side you would be gaining a bigger beta test team for those of us that wish to install it.

Just a thought. I know I would install it.
Thanks and 73,
Sam

Ofcourse I cannot speak for tentec and their firmware policy but below my reflection:

John invited people to join the beta test group when v3 development started. As a result there is a group of beta testers with various backgrounds involved (contesters, audio fantatics, software developers etc.), digging into root cause analysis for problems found in beta versions. The aim is to iron out the firmware prior to releasing it to the public. High participation of the beta members combined with confidentiality on findings allows tt and beta testers to work together more effective.

Just looking at the firmware reference number already shows the amount of work which took place since V3 started. This is where the dilemma starts... just releasing firmware to the public might look cool but how to process all the findings? How to connect findings to common root causes? How to investigate and interpret all comments? This versus organizing smal and dedicated beta team which would make it easier to connect to root cause etc..

Anyway, above is my personal view as beta member. now back to the shack testing the latest firmware...

Best regards, onno

Welcome to the club, Marty!

Having been an Orion owner for almost 10 years now, I can only say that no other radio can match it, especially at the price point.

I have the RX366 in my Orion II now and that's a real treat...you'll never know how much better it is, as you'll have started at the top!

This reflector is just great for all things Orion, and I know you'll really enjoy your new rig.

Good luck.

From: w2msj
Topic: 7837 Message: 7837

I just replaced the Caps on my A9 board. I noticed that in the two photos, I have, of the A9 board a connector labeled JP1-3 shows 2 white wires going somewhere. It would appear that this supplies 20.5 volts and gnd to ??? My 566 (w/o tuner) does not have a plug on term JP1_3. I searched the Schematic file on the TenTec site but could not find any connection on any other board that appeared to originate on terminal JP1_3 on the A9 board. Can someone enlighten me? Lynn Finch, W2MSJ

7840. AGC setting across 565 band stacking registers

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-21 01:34:28 UTC
From: Russ
Topic: 7840 Message: 7840

With V3 on my 565 I'm noticing that AGC settings cannot be set on a per register basis. I cannot remember how V2 register AGC worked, but if it hasn't been identified either as a bug or a want, I'd like to suggest that band register AGC values remain with each register as do mode, BW, and PBT settings.

With my 565 register A is for with SSB, B for CW, C for RTTY, and D for other data where each register has a unique AGC setting. As it is now I seem to be setting AGC much more often than before.

73, Russ

You are absolutely right. Is this wire in use for the 566? I guess with the different screen type as used in 566 this wire became obsolete?

Both PROG to .12s, 20 dB/s, 1uV
SLOPE = FLAT
No NB, No NR, No SAF
SAME PBT

7845. RE: [orion565] Re: Terminal JP1_3 on A9 Board

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-22 03:42:28 UTC
From: art davis
Topic: 7837 Message: 7845

I found this out when troubleshooting why my display would go dim during transmit. All the advice said to replace capacitors C6, 7, 8, 9 on the A9 board that were involved with the 5V regulator. This didn't make any sense since the display wasn't powered by the 5V supply. So I replaced the ones associated with the -20V supply (C1, 2, 3, 4) and the display has been rock solid since. The voltage on the pins of JP1 would sag about 3-5 volts during transmit.

You are absolutely right. Is this wire in use for the 566? I guess with the different screen type as used in 566 this wire became obsolete?

It would appear that this supplies 20.5 volts and gnd to ??? My 566 (w/o tuner) does not have a plug on term JP1_3. I searched the Schematic file on the TenTec site but could not find any connection on any other board that appeared to originate on terminal JP1_3 on the A9 board. Can someone enlighten me? I recently received a satisfactory explanation for the behavior of the HI CUT and PBT controls from Paul Clinton, Ten-Tec's Service Manager, the text of which is listed below. It is a very clear and concise explanation. Thank you Ten-Tec for being responsive and keenly aware of your customer's questions and needs.

My only comment on this would be that the HI CUT and BW controls appear to have the same function. This is not a criticism, but just an observation.

(John Henry also posted an explanation similar to Paul Clinton's as a rebuttal to Scott's original article on the Ten-Tec Wiki: http://tentecwiki.org/doku.php?id=565hilowcut)

73, from a PROUD Orion II owner,
Greg, N8GD

E-Mail from Paul Clinton, Ten-Tec Service Manager:

Dear Greg:

The operation of the PBT, Hi Cut And Low Cut on the Orion and Orion II are correct. This is NOT a bug in the firmware. These functions are correctly displayed on the screen to display what is actually happening with these controls.

PBT allow the operator to move the signal down the slope of the filter to get away from interference.

High cut only narrows the top half of the DSP filter and there is no need to change PBT because the signal is not being moved inside the filter pass band. So on Hi Cut only the narrowing of the high end of the filter is shown.

On low cut it is necessary to move the signal with PBT to keep it centered inside the filter pass band. PBT and the band width on the display change because this is actually what is occurring with the filter. As low cut is moved not only is the low end of the filter being narrowed but the signal is constantly being moved by the PBT to keep it centered in the filter pass band.

73,

> >
> > I recall reading a message on the TenTec Wiki (http://tentecwiki.org/doku.php?id=565hilowcut) regarding a problem with the opertion of the HI CUT control not updating the PBT value on the display, according to Scott Robbins. Only the BW value changes. The PBT value does update properly with LO CUT, though. Here is the quote from the Wiki:
> >
> > "The PBT and BW values are supposed to update on screen graphics and text - unfortunately compounding the confusion is a bug that is present when HI CUT is adjusted. LO CUT shows the adjustment of PBT and BW values simultaneously, while HI CUT only shows the BW update, not the PBT value. This needs to be corrected.
> >
> > Scott Robbins, W4PA "
> >
> > I know John Henry reads this Yahoo Group, so I am requesting that this correction be made in the firmware before it is released. It's not a problem with the actual operation or performance of the transceiver, but comes more under the screen display fixes, and I notice the V3.026 (and I presume 3.025 for the original Orion) still exhibit this (incorrect) issue.

7847. Orion 566v3.028 Posted

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-22 20:55:01 UTC
From: John
Topic: 7847 Message: 7847

Improvements include:

Version V3.028
Serial port fix resolving some invalid responses to computer queries
Fixed CW Sidetone Frequency after Transmit on FSK issue
Fixed PBT display issue when recalling from band register
Fixed SAF vs. RIT display issue
Tested/adjusted sweep display centering

Version V3.027
Resolved HW Mic not working

We appreciate your patience, and hope it was worth the wait.
The installer file can be found at:
www.tentec.com
Hover over "Downloads", select Transceiver Downloads
Scroll down until you see the 566 section, and on the right will be the installer file for Firmware Ver3.028

John Henry

7848. Orion 565v3.030 Posted

Yahoo group: orion565 (2009 — 2013)

Topic: 7848 Message: 7848

Improvements include:

Version V3.030
Corrected mishandling of DUAL/DIV with 366 installed
Changed FSK to default to MARK HIGH
Fixed CW vs. FSK sidetone issue
Removed RX366 filter selection if not installed
Added code to disable NR during CW record..to prevent recording problems
Fixed PBT display issue when recalling from band register
Addressed serial port responses for CAT programs.
Changed default to MARK HIGH
Removed Sub-Rx filters when RX366 not installed
SAF "S" Text overwrite with RIT
Addressed various screen gibberish issues caused by CAT involvement

We appreciate your patience, and hope it was worth the wait.
The installer file can be found at:
www.tentec.com
Hover over "Downloads", select Transceiver Downloads
Scroll down until you see the 565 section, and on the right will be the installer file for Firmware Ver3.030

Should another RAM clear and Maser Restet be performeed when coming from prior V3 or just a master reset or neither?

Thanks,

Brad

Hi Brad,

It is not necessary to perform either when going from an official released V3 firmware to an official released V3 firmware. If it is required, I will put the "required" in the release notes. But nothing in memory has changed between the two public releases.

However, with that being said, I know dozens of people (including some in TenTec service) who adamantly state that whenever performing upgrades/downgrades, master reset is required. We have had so many issues cleared by clearing the data and memories.

If you choose not to master reset, and you update the rig, and then have some odd side effects, then jot down your settings, and perform the master reset, answering yes to the "clear" questions, Yes/No to the RX366 installed question, wait for the ability to change the main vfo, power it off, back on, and you should be good to go again.

John

May be just me but after a V3 download a couple weeks back seemed like the (main) receiver was very noisey, tried the master reset and much more quite, as a result did the same after 3.028. All is well. DAN, K3XR

The same here with me. After installing V3.028 the receiver was very noisy and the S meter was on S2 on dummyload. I did a Master Reset and now all is again normal. The received is again quite and the S meter goes to S0.

I use Onno's Back up and Restore so I don't have to save my settings or write them down. Then I always do a RAM clear and then a Master Reset. Then use Backup and Restore to restore my settings.

What's to lose by doing that?

Just noticed increased download activity on previous releases. I would recommend 2951 to be installed since it addresses a couple of items not covered in earlier versions. Please see below for download details.

Regards, onno

I have a new Mac Book Pro running Lion and uses Parallels to run Windows 7
Can someone recommend an adapter that they know will work with this
configuration to upgrade my O2?

Also where can the adapter perhaps be locally obtained if possible.

Tnx and 73,

Mike

7859. 3.028 bug fixed

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-24 06:56:19 UTC
From: billw5ao
Topic: 7859 Message: 7859

The User 1 and User 2 functions save parameters correctly and do not revert to default values as did 3.026.

Also I did the update while at work and a power outage occurred after the update so I returned home to find the radio updated with all previous settings retained, without any master reset or clearing of memories.

The loss of RIT is very common in the Orion - connectivity becomes
intermittent as the Orion ages. There's some discussion archived at
http://tentecwiki.org/doku.php?id=565ritfix

My guess is that it was a coincidence that you first noticed this after
flashing the firmware.

No, don't do that - it's probably not the encoder - it's the connection.
Read the last posting on that link I sent you earlier.

From: John T. Fleming
Topic: 7863 Message: 7869

George,

Save your money! Order some Deoxit Gold G100L and using the directions in the V2 mod instructions, unplug the CPU board from the front panel and paint the “pins” that connect the CPU board to the front panel. Then reassemble the rig. A quick test of the problem before you do anything is the press along the edge of the area between the row of buttons starting with “MENUS” and the display. The female part of the pin connection is behind the buttons. By pressing the edge of the front, it causes the connection to be “exercised” and you will have a clean connection again. The connector for the Orion II is different and it does not experience the problem.

73,

John

7870. Update won't erase EEPROM first

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-25 18:14:49 UTC
From: Larry Menzel
Topic: 7870 Message: 7870

That about says it all.

I"m installing to my 565 from an XP machine with a hardware COM port, COM1.

Each time I try to start the Flash Update, the rig immediately starts PROGRAM FLASH without first erasing the EEPROM as it has in the past. It runs out to about 1086 lines and stops...every damn time.

Help.

Larry, W0PR

which installer version are you using? Did you install the latest version?

Furthermore which firmware is currently loaded?

Orion running well?

Did you do master reset prior to upgrade attempt?

If you want i can give you a call to walk you through a couple of verification steps. If you appreciate send me an email with contact details. I also have software which might help troubleshooting.

Best regards, onno

Helo, Onno,

Well, I finally got it to run, after many many starts. I turned off error checking, and it immediately erased the EEPROM and installed without error.

I did the usual setup after installation, Master reset, ROM reset, memory clear...now working perfectly, AND my second receiver works perfectly, which it did not in V3.025.

Thanks, Onno.

It happens occasionally on K4DLI's Orion II. The service manager, as he did with the Orion I, a while back said he had not heard anyone report the issue, but it is there--but apparently not as prevalent as with the Orion I.

John

After coming back from a weekend at the Buckhorn I turned on the Orion ll last night and the intermittent main audio level problem I mentioned to you earlier was back. The radio had been off for several days so it was totally cold. After being on for about an hour the problem went away as it had previously. I made a point of looking at the bar and it never went to half height as it would when muting.

I am beginning to think it might just be a cold joint on the pot rather than a firmware issue.

7880. High SWR Protection

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-27 16:17:50 UTC
From: Bob
Topic: 7880 Message: 7880

My Mark V has a power fold back build-in feature that protects the radio from high reflected power caused by high SWR. Does the Orion II have this build-in feature. The reason I ask is that for some reason I have no output power from my OII. I continue to search for the output power problem, but was just wondering about the fold back feature.

Thanks

If the Orion was folding back, it would indicate High SWR in the display.
The SWR is always indicated when transmitting.

Do you unintentionally have the Keying Loop turned on or the Transmitter
turned off in the TX Menu?

7882. upgrading frustrated

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-27 20:41:27 UTC
From: George
Topic: 7882 Message: 7882

I want to revert back to an earlier version software in my Orion 2 and when I try to upgrade, the Ten Tec upgrade fails and says "error encountered", "communications with the radio has failed bla bla bla".
I know I can communicate with the O2 because my logging program and HRD communicate fine with my O2.
I have the proper Com port set in the Ten Tec upgrade program.
I restart my computer and make sure my logging program or HRD is not running and then try to update the O2 and I still get the error.
I called Ten Tec and they couldn't help me. I did a RAM clear and a Master reset before attempting to upgrade with no help.
Anyone have any suggestions?
Thanks.

George W2YJ

7884. upgrading 566 fails, frustrated

Yahoo group: orion565 (2009 — 2013)

From: George
Topic: 7884 Message: 7884

I just upgraded to the latest version last week and it worked fine? Nothing has changed.

I even tried re-installing the latest version again and get the same error?

The Ten Tec program is getting faulty indications.

Is there a step by step recommended procedure that I can follow although I've tried every possible way of doing it with no help.

Any further ideas?

George W2YJ

HI

First thing is to look in HRD which Com Port you are using. (In the HRD main screen press Connect and under New you can see which com port you are using).

Then turn your radio off.
Push the USER2 button and hold it and turn the radio on, when the radio shows Flash Mode in the display release the USER2 button.
Do not touch anything on your radio now.
Run the file you have downloaded from TEN TEC web site. (update.exe)
Select Settings
Select Setup
Check that the marks is set in Serial Port and select the proper Serial port you found in HRD. Press Ok
Select Process
Selct Update Radio
Choose the .ruf file you want the radio updated with.
You should now be able to see in the ORION display that it is updating the radio.
After the update has finished Turn the radio off. Push the Main RX/TX button while you turn the radio on. Answer yes or no to the question coming up in the display.
You have now finished the update.

Good luck

Thanks for the tips but I've been through all this at least 15 times trying different ways. I even changed the Com port that the Orion2 was connected to thinking that the original Com port had a problem with Ten Tec's update process. Same error.
Let me say I did update my O2 just last week and it worked fine.
I can control the O2 fine using HRD or my logging software "DX4WIN" so I know my computer is talking to the O2 just fine.
I even re-started my computer just to be sure HRD or DX4WIN was not somehow holding up my Com port. No help.
It's something with Ten Tec's update process software and my computer.
I'm running Windows7 Home Premium 64 bit.
I'm at wits end but I won't give up!
Thanks for your suggestions.

Well I got it to start updating but in 10 minutes I've loaded 25 lines of over 9700 lines of code. At this rate I'll be able to use my radio next week, hi.

I re-downloaded the program from TT and it is at least doing something but not at warp speed.

My question is, can I abort this process so I can use my O2 sometime this week or is the code gone from the previous update?

Something just isn't right.

George,
Have you tried treating the update program as if the computer were running XP SP2? That is, right click on the 566 update program, the select troubleshoot and then let it start as if it was an OS of XP. I have had that work on a few difficult runs.

73,
Troy, W6HV

HI

First thing is to look in HRD which Com Port you are using. (In the HRD main screen press Connect and under New you can see which com port you are using).

Then turn your radio off.
Push the USER2 button and hold it and turn the radio on, when the radio

shows Flash Mode in the display release the USER2 button.
Do not touch anything on your radio now.
Run the file you have downloaded from TEN TEC web site. (update.exe) Select
Settings Select Setup Check that the marks is set in Serial Port and select
the proper Serial port you found in HRD. Press Ok Select Process Selct
Update Radio Choose the .ruf file you want the radio updated with.
You should now be able to see in the ORION display that it is updating the
radio.
After the update has finished Turn the radio off. Push the Main RX/TX button
while you turn the radio on. Answer yes or no to the question coming up in
the display.
You have now finished the update.

Good luck

Yes, I tried the XP mode with no help.

Right now I now have a box with lights on it. Simple process? Right!

At the present rate of downloading I'll have my O2 back in a month if I leave the computer and O2 on and down loading.

Thanks for every ones help.

I won't give up!

Per;
Thanks for the tips but I've been through all this at least 15 times trying different ways. I even changed the Com port that the Orion2 was connected to thinking that the original Com port had a problem with Ten Tec's update process. Same error.
Let me say I did update my O2 just last week and it worked fine.
I can control the O2 fine using HRD or my logging software "DX4WIN" so I know my computer is talking to the O2 just fine.
I even re-started my computer just to be sure HRD or DX4WIN was not somehow holding up my Com port. No help.
It's something with Ten Tec's update process software and my computer.
I'm running Windows7 Home Premium 64 bit.
I'm at wits end but I won't give up!

Thanks for your suggestions.

Topic: 7884 Message: 7892

I was able to get the O2 updated. I had to change the com port on the desk-top. It was the 3'ed com port I tried and it went OK. When will rig Manufactures use USB to communicate like my Icom IC-7600. Much easier.

My O2 is back up and running.

Thanks for everyone's help.

7893. update frustrated O2

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-28 13:30:20 UTC
From: George
Topic: 7893 Message: 7893

As I mentioned in a previous EMAIL I got my O2 upgraded but it was not easy. I had to go through 3 com ports on my computer before I found one that worked when even all three communicated with the O2 using HRD and my logging software DX4WIN.
My question now is, is there a good 4 port internal or external com port to a, high speed USB 3.0, external card or a good internal card available these days?
I currently have 2 internal 4 port serial cards installed and they both caused me O2 upgrade problems but work fine for HRD and DX4WIN communications.
Anyone making a good 4 port card these days?
Thanks.

Subject: RE: [orion565] upgrading 566 fails, frustrated

Per;

Thanks for the tips but I've been through all this at least 15 times trying different ways. I even changed the Com port that the Orion2 was connected to thinking that the original Com port had a problem with Ten Tec's update process. Same error.

Let me say I did update my O2 just last week and it worked fine.

I can control the O2 fine using HRD or my logging software "DX4WIN" so I know my computer is talking to the O2 just fine.

I even re-started my computer just to be sure HRD or DX4WIN was not somehow holding up my Com port. No help.

It's something with Ten Tec's update process software and my computer.

I'm running Windows7 Home Premium 64 bit.

I'm at wits end but I won't give up!

Thanks for your suggestions.

George W2YJ

HI

First thing is to look in HRD which Com Port you are using. (In the HRD main screen press Connect and under New you can see which com port you are using).

Then turn your radio off.

Push the USER2 button and hold it and turn the radio on, when the radio shows Flash Mode in the display release the USER2 button.

Do not touch anything on your radio now.

Run the file you have downloaded from TEN TEC web site. (update.exe) Select Settings Select Setup Check that the marks is set in Serial Port and select the proper Serial port you found in HRD. Press Ok Select Process Selct Update Radio Choose the .ruf file you want the radio updated with.

You should now be able to see in the ORION display that it is updating the radio.

After the update has finished Turn the radio off. Push the Main RX/TX button while you turn the radio on. Answer yes or no to the question coming up in the display.

You have now finished the update.

Good luck

Topic: 7895 Message: 7895

First, THANKS, for getting rid of the garbage on the display. I almost sent this rig back to get it fixed!! But that's gone now but I have 1 small issue that really does not effect anything and was wondering if anyone else had it. If I shut the rig off while SAF is turned on and then I turn the rig on, whenever, the SAF is still showing turned on via the display but SOMETIMES it's not functioning. When this happens I cycle through the SAF to off then back on and then it works. Not a issue that bothers me too bad but I'd like to know is it my setup or is it a software bug? Again this does not happen every time but it does often

Thanks for the updates,

John

All this sounds very complicated. I live an hour from the factory. I think after all the dust settles I will take the Orion II to them and let them upgrade it for a fee.

It's a computer issue and how we fare depends on:

- our computer expertise
- how often we use CAT control software with our Orion
- how readily we can troubleshoot computer port issues
- long term unperturbed state of the serial port used with Orion

Barry this is easy:

1). I am pretty good with computers, but not with hardware and programming.
2). Never. Purchased it a few months ago.
3). Know nothing about ports or issues.
4). I don't even know what this means.

Anyone else in my boat?

C. Richard Pumphrey

7899. updated O2 but received this at the end?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-28 19:39:54 UTC
From: George
Topic: 7899 Message: 7899

My O2 was updated this morning and is running but at the end of the update I received the message in parenthesis even though the rig is working? I went back to a previous version to test my non-working RIT control to see if software had something to do with it not working. I now know the RIT encoder needs to be replaced and I ordered one.

"Unable to update the radios flash memory with the selected file. Confirm that the radio is connected and powered and that the file is a valid ROM update file (RUF) for this radio."

What does this mean?

Thanks.

George W2YJ

Sorry George, old-timers disease kicking in again!

Go to http://groups.yahoo.com/group/orion565/files/ and get the file folder called Serial Port Testing submitted by PA1AP.

Art;

What attached program? I don't see any attached program in your EMAIL?

Thanks.

Just to make sure your radio's serial port is working OK, run the attached

program, if you haven't already.

Yes, I tried the XP mode with no help.

Right now I now have a box with lights on it. Simple process? Right!

At the present rate of downloading I'll have my O2 back in a month if I

leave the computer and O2 on and down loading.

Thanks for every ones help.

I won't give up!

George,

Have you tried treating the update program as if the computer were running XP SP2? That is, right click on the 566 update program, the select troubleshoot and then let it start as if it was an OS of XP. I have had that work on a few difficult runs.

73,

Troy, W6HV

Per;

Thanks for the tips but I've been through all this at least 15 times trying different ways. I even changed the Com port that the Orion2 was connected to thinking that the original Com port had a problem with Ten Tec's update process. Same error.

Let me say I did update my O2 just last week and it worked fine.

I can control the O2 fine using HRD or my logging software "DX4WIN" so I know my computer is talking to the O2 just fine.

I even re-started my computer just to be sure HRD or DX4WIN was not somehow holding up my Com port. No help.

It's something with Ten Tec's update process software and my computer.

I'm running Windows7 Home Premium 64 bit.

I'm at wits end but I won't give up!

Thanks for your suggestions.

HI

First thing is to look in HRD which Com Port you are using. (In the HRD main

screen press Connect and under New you can see which com port you are

using).

Then turn your radio off.

Push the USER2 button and hold it and turn the radio on, when the radio

shows Flash Mode in the display release the USER2 button.

Do not touch anything on your radio now.

Run the file you have downloaded from TEN TEC web site. (update.exe) Select

Settings Select Setup Check that the marks is set in Serial Port and select

the proper Serial port you found in HRD. Press Ok Select Process Selct

Update Radio Choose the .ruf file you want the radio updated with.

You should now be able to see in the ORION display that it is updating the

radio.

After the update has finished Turn the radio off. Push the Main RX/TX button

while you turn the radio on. Answer yes or no to the question coming up in

the display.

You have now finished the update.

Good luck

George - the answer is yes, but you may still have problems doing the firmware upgrade even with the best of cards. Contrary to popular belief, serial port cards are now being sold that fit the very small PCIe connectors on modern motherboards. Go to newegg.com and search on "4 port serial cards" and you'll find at least three of them. I bought a 2 port PCIe card recently while battling the firmware download problem. The problem is, you still have to deal with the shared IRQ problem and that can kill the download performance. What your new card will be sharing IRQs with depends on your hardware configuration, motherboard, etc. In my case, the only solutions that worked properly for the upgrade were: using the single com port on the motherboard (does NOT share an IRQ), and, using a USB/serial port converter cable.

It seems to me that Tentec could save themselves and Orion users a lot of grief if they would simply address the reason that their upgrade program fails to work properly on ports that work flawlessly with EVERY OTHER CAT application. I've found that Onno's Serial Port Testing program found in the files section here ran perfectly on a couple of my serial ports, but the Orion upgrade program simply would not work.

Someone with access to the upgrade code should be able to determine what the differences are and do something about it. I would certainly volunteer my time to assist with testing and get this thing put to bed forever.

Floyd;

WOW someone recognizes my problem. Are you suggesting I go for the single cable USB to Serial? I have one that I could try and let you know.

Thanks for your response and I guess this is an ongoing problem.

I called Ten Tec service department when I was having this problem the other day and they had no solution.

I am running two 4 port serial PCI cards in my computer and suspect some ports share interrupts or something like that. I could take a look at all the Com ports interrupts and see if there are any that don't share interrupts??

I have a 6 month old Intel MoBo and a Sandy Bridge I5 Intel processor with 6GB of ram on a W7 64 bit machine so I have the speed.

Thanks again for your suggestions.

Floyd;

Here is what I found with my two 4 port com boards. One says in, device manager, that it is a "pci to serial port" and the other card, a newer one, says "pci to high speed serial port".

The card that says "pci serial port" all the ports share a common interrupt of (12). The high speed serial card has different interrupts except for one of it's ports share interrupt with the slower card of (12).

I suspect this was the answer to not use a COM port that shares interrupt?

I see that the successful upgrade was on a COM port that had a unique interrupt.

Is this the answer? Interrupt sharing?

Topic: 7904 Message: 7904

Here is what I found with updating my O2 and the COM port cards.

1. Four port PCI internal card with shared interrupts, O2 would not update.

2. Four port PCI internal "high speed card" unique interrupts, O2 took 45 minutes to update.

3. USB to Serial cable O2 took 6 minutes to update.

I learned a lesson about those PCI internal 4 port cards. They are OK but not good for O2 updating.

You think TT would have known this and told me?

This is put to bed for me.

Thanks to everyone for helping me.

7905. Re: update frustrated O2

Yahoo group: orion565 (2009 — 2013)
Date: 2012-02-29 22:52:59 UTC
From: floydsense
Topic: 7893 Message: 7905

I suggest you go to Device Manager, select View from the top bar and then select "Resources by Connection". The resulting list will show you the IRQ used by each device in parentheses. On my system, there's one serial port on the motherboard, COM1, and that's the only device that uses IRQ 4. I have a 2 port PCI card and a 2 port PCIe card, both of which are seen to share IRQs with other devices on the system. Whether or not that is the root of the problem, I don't know. What I know is that the port on the motherboard works for the upgrade just fine. The 2 PCI ports won't work at all for the update. The 2 PCIe ports work, but the transfer runs so slowly that it would take a day to do the upgrade.

I can also use a USB to serial converter cable to run the upgrade just fine. I have a half dozen other programs that can access the Orion just fine over the ports that don't work for the upgrade program. One of these is Onno's serial port testing program.

If you have a serial port on the motherboard, I'd suggest using that, and otherwise use a USB/serial converter cable. I suspect the IRQ sharing has something to do with the problem, but I say that only because my unshared port works for upgrade, while none of the shared IRQ ports do.

Floyd;

It's solved. I did note the shared interrupts and that was the problem. I am now using a USB to serial cable and it works fine for updating the O2.

Thanks.

Call me crazy but WHY do you think that Ten-Tec should know that some of your hardware is not capable of doing the data transfer for the Orion update?

RS-232 is a standard interface with the standards pretty well spelled out. Unfortunately since the creation of the standard some manufacturers and software developers have chosen to ignore part of the RS-232 criteria.

In most cases they get away with these "adjustments" but in many cases they do not. Add to this mess a conversion from serial to USB and the problems begin to multiply.

So to blame a type of serial card is not quite right. It may well be that the blame should be pointed at a specific card manufacturer or even at one particular card that they produce.

USB to serial converters, both external and internal are not all created equal and the problem you describe certainly does not rest with Ten-Tec.

Hello

anyone try to debug A9 board? After replacing C6, C7, C9 (470u) with Low ESR caps the rig stop working. 13.8V present but no 5V (only 0.5V) and no -20V (only -3V).
I also replace the LT1054CS8, but still no potential.
Any hint will be appreciated.
Thanks in advance!

Hi Adi. Why did you replace the LT1054? Were you not getting -20.5 V? This voltage powers the LCD display.

Look at all the solder joints you performed with a magnifying glass if possible and make sure they are clean. Then just start working through the components until you find no voltage. There aren't that many so it shouldn't take long time. Make sure to measure all voltages on the pins of the LT1054.

Hi Art

thanks for reply. Yes, -20V was missing as well as +5V. Fortunately I was able to fix the board just couple of minutes ago. On the capacitor replacement procedure, some solder joints was exfoliated and there was a missing ground. Now I fix that and do the upgrade to V3.

Thank you!

All the best from YO land!

Rick - regardless of all this, the genesis of this situation is that there's something different about the Upgrade program and how it's using the Com ports. I was writing code for RS-232 interfaces decades ago and you're right - many developers ignore many aspects of the protocol and the basic reason is that it's possible to get data to flow without following the protocol of the interface lines. So, both software and hardware developers take shortcuts and in many cases those shortcuts fail.

And, problems are much more likely to occur with clock speeds of 56 kbps. It may well be that the Tentec code is following the RS-232 protocol precisely and it's the only program of the many that we use with the Orion interface that does things right. But, we really don't know anything about the error because the Tentec code doesn't give a clue what the problem might be. No need to guess here - the code detected SOMETHING that either didn't occur, or that occurred in error. Anyone writing communications code ought to know that it's important to reveal the details of an error so that someone can do something about it. This situation with the Upgrade code is especially absurd since Onno's Serial Port testing program is able to communicate perfectly with the Orion over the same port that the Upgrade program fails on 100% of the time.

What I expect is that someone at Tentec would at least take a hard look at what the differences in the code are and take a stab at a solution. Instead, Tectec remains silent on the issue. They wrote the code, they distribute it and they should be responsible for resolving these issues.

7912. Orion 565 V3 upgrade (3.30) impressions

Yahoo group: orion565 (2009 — 2013)

Hello

some impressions after Orion 565 V3 upgrade.

1. rig response/menu access quite slow.Rotating the encoder result in a slow change of the value, for example RF gain or navigating through menus. Is that because of the hardware platform a little old for the new software or I did something wrong?
Anyone notice that?

2. SAF is working very good, but it will be great to have the possibility to memorize the settings by mode.

3. Receiver (although great) it seems quieter now.

please keep in mind that the firmware update procedure is using a different serial routine to flash the orion. Each line of instruction includes crc check before moving to the next line of instructions. In case cts is not working the flash sequence will be very, very slow and one is just lucky if it completes.

When update doesn't work : 9 out of 10 the flash procedure breaks due to invalid drivers, outdated windows environment (run windows update with custom and not express) and /or bad serial cables.

Although not recommended, during normal operations one can ignore cts and just control the orion. The issue is that faulty cables are not noticed because of this and only when going into update mode things become frustrating.

The solution to this seems simple:
1- just use usb to serial dongle which will cost about 8 dollar
2- use the original serial cable ten tec provided with the orion. Dont build smart serial cables which ensure cts is always up etc... thats just fooling the system and hence the operator.
3- perform update with stop on error.... if it doesnt continue stop the update and fix the serial connection first.

I will work on an extended serial port tester which allows you to confirm if cts is working. Hope to make it available this weekend.

Regards, onno

Just as an add.The USB to Serial you used with XP will not work with Vista or Windows 7. I replaced all my old adaptors with the newest, and they work great.

Hi Onno. If the problem is that clear-to-send is not coming up when it should, that would be a simple addition to the error message. Then we'd know that there is either a delay (maybe caused by shared IRQ problem) or CTS is NEVER being returned. That might indeed indicate a bad cable, etc. When I was having problems getting the upgrade started here, the error message would appear immediately upon starting the upgrade, leading me to believe that Upgrade couldn't access the com port, particularly because the error message was a bit garbled - didn't identify the port where it might have. It appears that once the download begins, the program does handle delayed CTS and that's probably why the download can take 45 minutes on ports with shared IRQs. At the very least, the Orion manual should be updated to indicate that the Upgrade program actually uses RTS and looks for CTS to be returned. I've always found it surprising how many other communications programs these days make no use of the control signals at all, depending on an error free transmission every time.

7917. [orion566] Re: update frustrated O2 FINAL SOLOUTION!

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-02 20:14:34 UTC
From: pa1ap
Topic: 7904 Message: 7917

As far as I know CTS is brought down when the Orion wants to tell the computer to stop sending information. Typically this is when the orion is busy and does not have time to process the serial stuff.

The trick is how to cause the orion cpu to be (very) busy.....

The only way I see to validate CTS;

A.... (confirm the CTS wire is connected to CPU)
1) power on orion
2) connect serial port and start CTS detection
3) confirm CTS is high
4) power down Orion and confirm CTS is low
5) power on orion and confirm CTS goes high again

"this will capture non connected CTS pin as well some serial cables which cross wire RTS to CTS...."

B.... (cause the CPU to be busy)
1) power on orion
2) connect serial port and start CTS detection
3) confirm CTS is high
4) read memory bank, write memory bank and repeat this very quickly about 10 x... So far I have found this combination to cause Orion 565 (dont know 566) to start bringing down CTS.

I will include two buttons to include this sequence in the serial tester program. Hope I still have the source as I lost one of my drives...

Anyone using OBR for 566 by any chance? And noticing TX Wait (red) to flash once in a while during memory backup or restore? It might also occur during backup setting especially at the end when AGC mode is being copied... Please share in the forum if you see TX Wait occuring and if you use 565 or 566... Looking for 566 confirmation :-)

Furthermore I will check if I can find an easy way to read the type of serial hardware used and after the test copy this to an email button. This way we can collect a list of known good/bad hardware in quick way. Of course you will need to send me the email after the test....

Hope this can help resolve the update challenge.

Regards Onno

>
> Hi Onno. If the problem is that clear-to-send is not coming up when it should, that would be a simple addition to the error message. Then we'd know that there is either a delay (maybe caused by shared IRQ problem) or CTS is NEVER being returned. That might indeed indicate a bad cable, etc. When I was having problems getting the upgrade started here, the

error message would appear immediately upon starting the upgrade, leading me to believe that Upgrade couldn't access the com port, particularly because the error message was a bit garbled - didn't identify the port where it might have. It appears that once the download begins, the program does handle delayed CTS and that's probably why the download can take 45 minutes on ports with shared IRQs. At the very least, the Orion manual should be updated to indicate that the Upgrade program actually uses RTS and looks for CTS to be returned. I've always found it surprising how many other communications programs these days make no use of the control signals at all, depending on an error free transmission every time.

> > >
> > >
> > >
> > > Rick - regardless of all this, the genesis of this situation is that there's something different about the Upgrade program and how it's using the Com ports. I was writing code for RS-232 interfaces decades ago and you're right - many developers ignore many aspects of the protocol and the basic reason is that it's possible to get data to flow without following the protocol of the interface lines. So, both software and hardware developers take shortcuts and in many cases those shortcuts fail.
> > >
> > > And, problems are much more likely to occur with clock speeds of 56 kbps. It may well

be that the Tentec code is following the RS-232 protocol precisely and it's the only program of the many that we use with the Orion interface that does things right. But, we really don't know anything about the error because the Tentec code doesn't give a clue what the problem might be. No need to guess here - the code detected SOMETHING that either didn't occur, or that occurred in error. Anyone writing communications code ought to know that it's important to reveal the details of an error so that someone can do something about it. This situation with the Upgrade code is especially absurd since Onno's Serial Port testing program is able to communicate perfectly with the Orion over the same port that the Upgrade program fails on 100% of the time.

Would someone please advise me as to which of the V. 3.xx versions of firmware seems to work the best for a 565, modified for V. 2.xx firmware { i.e. - pcb trace(s) cut }...?
Thanks.

73,

Jim, K8OZ

Just install the latest available for the 565, which should be 3.030 I
believe

I am using the latest version, v3.03, and it works great as far as I am concerned. I don't think you would lose anything by making the upgrade, and your RX performance would be better than where you are right now.

7921. SSB output

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-03 18:43:53 UTC
From: Larry Menzel
Topic: 7921 Message: 7921

Hi, guys,

Well, setting up for the DX contest today, I saw a spot for VP5M which is operated by guys from our club, W0GJ, WA0MHJ and K0MD.

Anyway, I switched over to 10 meters on my Orion (also have an OII) and gave Glen, W0GJ, a call. To my surprise, I had only 8 watts of output on SSB. I can scream into the mic...most I can get with mic gain at 60 is about 20 watts. I expect to see lower output PEP on SSB, but 20 watts? I cranked the output power to 100 with not much change, in fact, I get the same ssb output with the power setting at 50 as I do at 100.

Checking a bit more, I find that I have full 100 watts out on cw, but can't anything near that out on SSB.

OK, checked everything, Audio, SSB settings, mic gain, processor, H/W mic gain, everything you'd check, even put on another mic cable (thru a microHAM 2R+ usually) but nothing increases my SSB output. Same results with both my PR781 mic and my Heil headset. BTW, all work fine on the Orion II.

Further checking, finds excellent 80+ watts on 40 and 75, Same settings on 20 yield 40+ watts. Why the huge drop in sideband output on higher frequencies? And again, same power output with my power indicator at 50 or 100 on 15 and 10 meters. I get good power variability on ssb up through 40 and then start seeing the drop off.

Anyone else have a possible solution? Don't think there's anything wrong with my finals, etc, as output on CW is just fine. I just loaded V3.30 but that's a different story, there I have no receive on my second receiver and other issues going on.

Thanks.

Larry, W0PR

Well, Tom, without sounding catty, Yeah, not my first rodeo.

Yeah, no that's not it. My meter is a Array Solutions Power Master and pretty darn fast.

Wish it were that simple.

Larry do yourself a favor.. MASTER REBOOT.. see if that clears it up. Anytime I get a weird reaction to the rig (no power out or no signal are two that have happened to m O1) I do a BATTERY FAIL reset and it comes back..

Good luck

John

Topic: 7918 Message: 7928

So are you saying there is an upgrade from 3.028 for my O2 ? If so, I don't see it on the download page. Last night is the LAST NIGHT I can put up with the carriers close to my operating frequency. I can't use the AN (auto notch) because it causes Pops and Clicks on the line output and without it I get the Squeals and Tones. Increasing the threshold didn't help at all.

So if there isn't an upgrade or quick fix, than I'll have to go back to 2.039d until a fix is found.

Someone please let me know if 3.030 (or whatever it's called) is available for downloading. Thanks in advance.

73,
Sam

I am using the latest version, v3.03, and it works great as far as I am concerned. I don't think you would lose anything by making the upgrade, and your RX performance would be better than where you are right now.

Would someone please advise me as to which of the V. 3.xx versions of firmware seems to work the best for a 565, modified for V. 2.xx firmware { i.e. - pcb trace(s) cut }...? Thanks.

Loaded V.3.03 on my 565 and no issues here. Full power on all bands, both SSB and CW. I did not do a master reset after the down load, either.

Sam -

3.030 is the version & revision for 565 Orion you see in Downloads on the TEN-TEC site.

3.028 is the version & revision level for 566 Orion II you see in Downloads on the TEN-TEC site.

There were additional changes specific to the Orion that stepped it by two revision levels over the Orion II.

The changes are documented very well in the revision history notes that are also posted in the TEN-TEC downloads.

I hope this helps with the version/revision state. I can't speak to your 566 Orion II's AN issue.

Regards,

Gene

Thanks Gene,

I guess I'll just have to go back to the 2.039d version until the T*T comes up with a fix as it's no good to me the way it is now. Version 3.028 makes my $5,000 radio sound like a $5 toy, and we all know that's not the case. As a former software writer / author, I know that by changing one variable in the code can cause all kinds of havoc in the code further down the line. My guess is that's what is happening here. In fixing or adding one feature, another one has been compromised.

NOTE to the software engineers: Any new version you want me to try out, beta or otherwise, send a link to my email address.

Spent many hours listening to the receiver on the O2 after downloading the latest V3. . Find all versions of V3. have a negative impact on the quality of the received SSB audio when the NR circuit is engaged, even on the lowest setting. Read the comment in these postings of the audio sounding "underwater" that would seem to be, for lack of a better description, a good assessment. Also noticed a receiver that seems to exhibit much more noise, which to some degree, has been resolved by doing a master reset. While it is true that adjustment of AGC in the areas of hang, delay, threshold can improve the NR audio problem, it's not a cure. Returned to V2.044A which exhibits a much better NR function on SSB. Have these modern receivers become so complex that their advanced performance has been negated by the reduction in user friendliness? Simply should not be spending huge amounts of time trying to achieve the desired results.

We might have found the problem and appreciate your help.

I assume you have your 10m antenna connected to ant1 output? Could you move this to ant2 and test for power output? I realize it sounds weird but appreciate if you could do quick test. Let me know how it went?

Best regards, onno

From: Larry Menzel
Topic: 7921 Message: 7937

Well, I just reloaded 3.025 and the radio exhibits the same thing. It maxes output at 36 display, with no increase to 100.

Still getting full power out on CW however. Radio works perfectly in every other respect under 3.025.

Barry, did you come up with anything?

Larry, W0PR

which TX connector are you using? ANT1 or ANT2? Could you swap them and check again? I realize it sounds a bit weird but please try.

Yes Larry, change to ANT2 like Onno is suggesting - it fixed my problem.

Sorry, Onno. I just now saw your reply. I switched it over to antenna two with no change. I still get full output on SSB and CW using antenna 2 on 10 meters. As far as that goes, on all bands.

Gary

7942. RIT fixed in my O2

Yahoo group: orion565 (2009 — 2013)

From: George
Topic: 7942 Message: 7942

I did everything I could think of without going inside the O2 to get the RIT to change the frequency with no help. I ordered 3 encoders and replaced the CUT, MULTI, and the RIT/XIT encoders and the O2 is working fine now. Six months ago I had to replace the PBT/BW encoder and should have replaced all of them while I had it stripped down.
The volume controls are working fine and I noted that they use the same encoder control. All 6 controls use the same encoder control.

Yes, not engaged, I'll try it.

Nope, Antenna 2 is the same. 20 watts max on 10, I do have a tuner, but of course, it only works on Antenna 1.

Engaging or disengaging the tuner makes no difference.

7945. Orion 1 sweep rang adjust range ?

Yahoo group: orion565 (2009 — 2013)

From: force2ak
Topic: 7945 Message: 7945

Orion 1 Firware version 3.025, just wondering if I'm missing
something my RX menu has Sweep display On or Off while the manual
shows Sweep Range adjustable with ranges widths of 4.5, 9, 18, 36, and 72 Khz.
Am I in the wrong menu ?

Regards - Alan

7946. Re: [orion565] Orion 1 sweep rang adjust range ?

No, you're in the right menu. Mine is the same, btw, just on and off. On
my Orion II, I get the choices you mention but not on Orion now.

Looks like it's fully on at 72 kHz. as I look at the display.

Dunno. Must have been a change in 3.XX firmware.

Larry, W0PR

7947. Re: SSB output

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-04 21:34:39 UTC
From: pa1ap
Topic: 7921 Message: 7947

Hello Larry,

Work in progress to reproduce the issues as observed. We found some clues to where it might reside but information seems to conflict each other.

1) with my 565 and internal tuner I observed 10M output to be very low, combined with very high powersupply current drain (25AMPs)
2) point 1 without internal tuner enabled...
3) change ANT1 to ANT2 solved the issue. I had about 70Watts peak output on 10Meter. ALC happy and such like. Barry found similar results.
4) performing the following sequence solved the issue for ANT1; enabled tuner, tune on a frequency, disable tuner and problem fixed. somehow the tuner was not in bypass mode. Could be a isolated problem.

There could be several reasons for the problem as observed. We are trying to reproduce the problem since it is not always there it seems.

Could you check the power supply current drain and report back the approximate current? Simply compare with CW at 100Watt and share if its 10,20,30% of maximum CW. Sorry I don't have direct answers and I hope TT can pick up the investigation soon.

///

With regards to ALC... It is known that higher frequencies will need some more umph on the orion. I am using the 708 mic and have the following settings which work well for all bands; mic potentiometer at factory default, mic gain at 50%, H/W mic gain at 15dB, SP at 0 (i dont use that anymore), TX eq at -5dB. Those settings give me good audio and at all bands ALC follows the peaks nicely. On lower bands I can lower H/W mic gain to about 10dB but it makes no difference in audio quality (worse or better)... So I settled with settings above.

Best regards, Onno

7948. Re: [orion565] Re: SSB output

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-04 21:39:05 UTC
From: Larry Menzel
Topic: 7921 Message: 7948

*Well, guess what, fellas? I just loaded 2.054 back on my Orion. And I have FULL 100+ watts on 10 meter SSB, as well as all the other high bands. *

So, it's definitely a 3.XX version issue, and nothing is wrong with my radio, or so it would seem. I felt this way from the beginning because my CW/RTTY output was fine.

Anyone got an answer other than firmware?

Larry, W0PR

PS...I'm going to reload 3.03 and see what happens.

Yep...back to 3.03 and back to no output on 20 thru 10 meters.

Guess that cinches it for me.

Be talking to John Henry in the morning.

I have a O2. It is a Great radio.
I just finished the latest upgrade. It took about 200 seconds. As with the last couple upgrades it loaded without incident.
I use a an old xp pro computer with a dedicated serial port, ie no adapters. The serial cable works with my pic programmers and atmel programmers.
I will have to keep that computer and cable around for a while :)
Firmware issues come up every time there is an upgrade.
I guess what we need is a utility to test your setup before you do any upgrades to let you know what your com port is and whether it is shared and thus able to upgrade the firmware.
Also if someone could source a "known working" usb to serial cable that works with XP, Windows 7 and whatever comes out next.
This could save people a lot of grief.

Just found out I have the same problem. With mic gain at 100, I get about 50W out and the ALC light still does not come on. CW is OK. On 15 I get 90W with gain set at 15.

Wish I had an amp with 10M on it!

7952. Serial port tester V1010 to test serial cable before performing an upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-04 22:35:10 UTC
From: pa1ap
Topic: 7952 Message: 7952

Greetings,

In between jobs I have included the stress test function (memory read and write) as well ANT toggle function within the serial tester.

It should be self explanatory;

1) install the program (unzip and click on the Serial tester 1010.exe file
2) step 1 -> select the serial port anc click connect.
3) step 2 -> the program will check the port status as well CTS status. and include some text to help. If its green its good.
4) step 3 -> power cycle the orion and check if CTS goes from green to red and back to green again. this to check and confirm cts wire
5) step 4-> click on the button to see if something happens with orion
6) step 5 -> click on memory load test sequence and observe the CTS status... it should go red once in a while. This is not an error but good signal that the stream of data is send to fast to orion. If it doesn't happen first time, just click the button second time.. You can also make it more busy by giving the VFOA a big swing during the test. Second you can also click on the ant toggle load test. Same thing but it might cause more / less cpu load.

Step 5 will show CTS mechanism. Especially when you turn VFOA during the test I would expect the CPU to be very busy.

Let me know how it goes. If your test does not do anything with CTS than it is very likely a wrong cable and/or device driver.

best regards, Onno

7953. Comparison of V3 to V2 Audio Quality

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-04 22:53:35 UTC
From: orion565-owner@yahoogroups.com
Topic: 7953 Message: 7953

Hello O2 Fans:

After a rather long conversation with KL7HRN, who like myself has had the O2 since it was first introduced, I found that Ed and I shared some identical thoughts regarding the comparison of the new and older firmware.

Ed had already switched back to V 2.044a after many hours with V 3.038. He felt that the audio quality with the V2 firmware was quite superior to the new V3. He generally does not need to use NR because of his location, and felt that the clarity of the newer firmware, does not equal the earlier releases.

I also must admit that a must agree with this, particularly if the NR is engaged. It is really hard to say what is happening here. Weaker signals probably do not produce a poorer audio quality, but the radio is generally noisier and the NR does not seem to work as well with the receiver noise floor. The stronger the signal being received, the more evident the quality difference seems to be. Whether this is also due to other nearby strong signals when the band is wide open, is also hard to say.

The Hardware noise blanker in the new firmware seems to be very effective in reducing electrical hash, but the resulting distortion from nearby strong signals makes its utilization difficult. Too many pops, clicks, and general trash are produced when strong signals are present.

Although I have a 5 element mono band yogi on 20m, and perhaps overload might be a problem, I have tried all levels of RF gain, and find nothing which will solve the distortion and clarity problems.

During my 20 hours or so of testing, I also encountered two glitches. One problem was found when trying to change step size on both the main and sub receiver. Rebooting the radio solved this problem. The second major glitch was found after changing bands, neither the hardware NB or the NR would work, and rebooting the radio did not solve the problem. A master reset did solve the issue.

I have loaded V 2.044a today, and I am again extremely satisfied with my received audio quality. There were a few other changes which I had to reset, such as the need to change both TX and RX equalization, and microphone gain settings.

In all the years I ran V 2.039d, I never had even one glitch in the radio, not one. I did not expect to find these issues in the latest release. I will use Ed's suggestion and explore V 2.044a until something else becomes available.

73 and Happy DXing,

Mike
W2AJI

7954. Re: [orion565] Re: SSB output

HI, Onno.

OK, I told you a while ago that I went back to 2.054. Everything works.100 watts out on 10-20 meters SSB,

I reloaded 3.03 and the same problem manifested itself. Reloaded 2.64Xg, 10 meter ssb was better, but when I kicked in the speech processor, BANG output dropped to almost nothing!

Reloaded 2.054, and once again, 100 watts on 10 meters, SP working as it should, and both receivers working well (had second receiver problems, too, with 3.03).

Changing antenna inputs does nothing. I don't have anything to check current draw so I can't answer that question. I checked ALL coaxial connections between the radio and antenna input, and all is well there as well. I went straight from the radio to the antenna, got the most power, of course, and so tried everything in between.

Barry, try kicking your SP in and out and see if it has any ill effect on output power. Sure does here in 3.03. No problem at all in 2.54. No screen issues either, like 3.025.

I think I'll leave well enough alone and stay with 2.054 for the time being. I hope John Henry is watching this thread. There may be a bug in the recent release.

Hi, Jim, yep...same here, my OII is working perfectly! I put the new RX366 receiver in it, as well, now I'm *really* happy with it.

My update problems are with my Orion (original). Back to previous 2.054 firmware and everything works again.

Interesting, Mike,

I live in a pretty low noise environment here, so I rarely use NB or NR. I find the new SAF feature too good to give up, regardless, plus, I have the RX366 installed, so v3 is the only option I have. I find that the latest version 3.028 works very well, with both receivers. I think the SSB audio is excellent, especially if one adds a little tweak to the audio rx eq.

I have had no reason to reset mine, at all...so we'll see. The RX366 makes the second receiver simply exceptional. I was listening around to some pileups today, and the clarity and excellent receive characteristics we only enjoyed with our main receiver is now the same on the new '366. Couldn't be more pleased.

I listened around in the SSB contest alot this weekend, and looked for interference situations. I was very pleased with the discrimination, especially on SSB, that the radio now has with the new firmware. I think it's pretty darn good. I have some issues with 3.xx firmware on my original Orion, and I'm going to have to talk with Paul Clinton or John Henry about that this week. See the other thread on SSB output.

The O2 is a great radio! Enjoy.

Using an Orion, not an Orion II, but I find the v3 ssb rx audio exceptional (and trust me, I'm VERY picky). Never use NR however, and never will.

Until someone posts a recording of the inferior rx audio some are reporting, we're all just blind men on the elephant trying to respond.

The NR creates a lot of distortion on signals at the noise floor. But I owe a number of new DXCC credits on 160m cw to it. The resulting signal may not be T9, but it's the QSO that counts. This feature of the Orion took me several years to learn to use it effectively, but it's wonderful. I do have a mike but am not sure where it is at the moment, so I can't comment on SSB usage.

Subject: [orion565] Serial port tester V1010 to test serial cable before performing an upgrade

Greetings,

In between jobs I have included the stress test function (memory read and write) as well ANT toggle function within the serial tester.

It should be self explanatory;

1) install the program (unzip and click on the Serial tester 1010.exe file
2) step 1 -> select the serial port anc click connect.
3) step 2 -> the program will check the port status as well CTS status. and include some text to help. If its green its good.
4) step 3 -> power cycle the orion and check if CTS goes from green to red and back to green again. this to check and confirm cts wire
5) step 4-> click on the button to see if something happens with orion
6) step 5 -> click on memory load test sequence and observe the CTS status... it should go red once in a while. This is not an error but good signal that the stream of data is send to fast to orion. If it doesn't happen first time, just click the button second time.. You can also make it more busy by giving the VFOA a big swing during the test. Second you can also click on the ant toggle load test. Same thing but it might cause more / less cpu load.

Step 5 will show CTS mechanism. Especially when you turn VFOA during the test I would expect the CPU to be very busy.

Let me know how it goes. If your test does not do anything with CTS than it is very likely a wrong cable and/or device driver.

Larry,

I do agree that 3.028 is excellent with SSB. I have NO problems with the front speaker audio. My problem is a result of the Line Out in the rear. I do a lot of recording, plus have my main audio piped through my studio mixer via the Line Out and when the AN feature is turned on the audio pops and clicks on the LINE OUT ONLY, not the front speaker.

If I get a chance I'll 1) look at the O2 schematics to see if I can pin point the audio routing and 2) make a recording for this group (it won't be hard, just need to find the time). My health is bad, my baby boy (13 yr old German Shepard) is on his last leg and I have a honey-do list 10 miles long, but I'll try and fit this in.

And quickly, IMO the audio from 2.039d was excellent. So far it's too early for me to say if 3.028 is any better, but I don't think it's worse. I'll be able to tell better once T*T fixes this Line Out bug.

Floyd, I'm not talking about the NR feature, reread the thread. It's the AN (auto notch) feature and the pops and clicks are only on the LINE OUT in the back.

Although the NR still makes people sound like they are underwater.

Sam - also have an O2 here with the latest V3 installed. I rarely use the NR function, but after reading your post I tuned around on 20 SSB listening for very weak stations to try it with. Most of the time, the NR improved the copy a bit and it sounds about the same to me as it did with the 2.044 release.

7963. V3 and 565 Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-05 07:54:31 UTC
From: storygene
Topic: 7963 Message: 7963

A few weeks use of the V3 firmware including the latest iteration V3.030 continues to make me feel like I have an entirely new radio. The NB, NR and AN controls work great as well as the wonder SAF feature. This rig is without a doubt, the best I have ever worked with to optimize a signal.

Re earlier discussions about the RF Gain control on the Multi knob, this works fine for me as-is but I certainly think a dedicated control for RF Gain would be nice on whatever the next generation rig will be. Meanwhile as someone else suggested, a menu change to allow the optional Remote Encoder to control RF Gain would be outstanding.

Don't get upset Floyd... I didn't write that. That was part of the thread K3XR (I believe) wrote. My problem has been with the AN feature all along, however I really don't like what the NR feature is doing either. I'll wait until close of business today to see if a new version is posted (or at least announced), if not it's back to 2.039d for me.

As far as I'm concerned, your opinion as well as others is always welcome.

73,
Sam

Returned to V2.044A which exhibits a much better NR function on SSB.Ã‚Â Have these modern receivers become so complex that their advancedÃ‚Â performance has been negated by the reduction in user friendliness?Ã‚Â Simply should not be spending huge
amounts of time trying toÃ‚Â achieve the desired
> results.

I'm going to post an audio clip I made earlier, but keep in mind this one is mild compared to what I normally hear.
This will give you an idea of what v3.028 is doing Barry, the software team and all others (at the LINE OUT jack in the back).

Using an Orion, not an Orion II, but I find the v3 ssb rx audio exceptional (and trust me, I'm VERY picky). Never use NR however, and never will.

Until someone posts a recording of the inferior rx audio some are reporting, we're all just blind men on the elephant trying to respond.

7970. Re: [orion565] Comparison of V3 to V2 Audio Quality

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-06 12:51:28 UTC
From: Sam W Jacobs CET
Topic: 7953 Message: 7970

I don't understand the question Barry.

I record.

I use AN to get rid of the tuner-upper squeal.

By using AN I get Pops and Clicks in my recordings.

By NOT using AN I get Squeals in my recordings.

USING 2.039d I can use AN and have NO Pops and Clicks or Squeals. WORKS PERFECT !

USING 3.028 I CAN'T use AN, I get Pops and Clicks if I do - Squeals if I don't. FAILS

Solution: Go back to 2.039d until a fix is found (today). I haven't yet as I thought maybe T*T might want me to do a test or two. I don't know if they are even on this bug fix but I hope so.

Again, this is on the LINE OUT jack on the back, not on the front audio. The line-out on the back is a constant volume and suitable for use with recording (when it works).

I hope this helps. The audio post I made was a duplication of the BUG associated with 3.028 with the AN on = distortion w/ Pops and Clicks.

73,
Sam

Bandstacking register designation - will go A thru D for each band.

Duane Calvin, AC5AA

Each band has 4 registers, A-B-C-D. Try it. Press the 80 (mtr) button 4 times and it (blue box) will go from A to D. You can put in a different frequency for each letter (or register). This applies to every band, 160 through 10.

Now press the 20 (mtr) button 4 times, A-B-C-D will appear in the "blue box". Try it.

Thanks guys. I wish the manual had mentioned this. I also just found an excellend description of this in a 4.24.11 email in this group. The little gray cells now understand. This is something that I will use.

I have only had the O2 since last August and am still finding out new functions. This is one great rig.

I'm back to 2.039d and right off the bat I notice a BIG difference.
To make a true comparison, you almost have to have Two O2's, side by side, however the audio using 2.039d is so much smoother and the Auto Notch filter is back working just fine.

I think I'll stay here, unless T*T asks me to test the AN feature with a newer release. I just hope that when they do release another version, they test for the pop's and clicks at the LINE OUT jack on the back using the AN feature.

I'm happy again although I was getting use to the SAF, damnit (lol).

Does NR even do anything other than distort rx audio? This questions assumes volume and RF gain are adjusted to eliminate band noise....if that is done does the NR even add any value?

IMO, that is a very good question Brad. The science of "noise reduction" is hit 'n miss. Even the "Clear Speech" types of speakers haven't perfected a reliable NR, everyone sounds underwater.

I did note that T*T's attempt at improving the NR feature in version 3.028 seemed to have worked somewhat, however no where near usable for me. Any improvement that was gained in the NR circuit clearly had a negative effect on the AN circuit.

On my O2, the NR is constantly in use. There is NO degradation in audio until turned up almost all the way with 3.038.

Check out these youtube videos search for 3cx800 channel. The NB video uses both the NB and NR. There was no degradation going to 3.038.

Thanks Bill however I don't know how busy you are through-out the day, but I only have so much free time. Could you provide a direct YouTube link to follow and I'll gladly look at the video. Otherwise I don't have time to search for it.

73,
Sam

On my O2, the NR is constantly in use. There is NO degradation in audio until turned up almost all the way with 3.038.

Check out these youtube videos search for 3cx800 channel. The NB video uses both the NB and NR. There was no degradation going to 3.038.

Bill

The video Barry refers to reflects how it worked and sounded at my 80 year old house in a crumbling infrastructure urban environment. Quite good, and my radio is an older 565.

7982. OII v 3.028 RF Gain encoder rate nuiscance bug?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-08 01:44:05 UTC
From: w1nt
Topic: 7982 Message: 7982

Is it me or does the encoder change the rate of the SUB RX RF gain at a rate twice as fast as the MAIN RX? I am experiencing 1/2 knob rotation for 0-100 on SUB vs. 1 knob rotation on MAIN.

Brad

7983. OII Speaker audio leak

Yahoo group: orion565 (2009 — 2013)

From: w1nt
Topic: 7983 Message: 7983

Noticed for the first time today that the internal speaker leaks a small amount of audio even with phones plugged in. Is this normal and is the only way to fix this to unplug the speaker connector under the top cover (or install a switch)?

Thanks,

Brad

Strange, on a fairly decent signal I get almost instantaneous ill effect the second NR is turned on. Yes, noise goes way down, but signal also tends to get warped or warbled sometimes to the point that it's not even worth it. I surmise noise type plays a big role as to how effective the NB/NR really works.

Same as Brad and Sam....there is no question, on my O2 the NR function degrades the SSB received audio regardless of setting of the NR and AGC. Back to 2.044A which is very good at reducing receiver noise. DAN, K3XR

Hi Sam,

I agree noise reduction isn't working perfect and especially for ssb it tends to do more harm than good but I had the same experience with v2 code. The noise blanker works good on my side but it dependents on the type of static noise on the band. And if I forget to disable noise blanker during strong signals I hear distortion too.

7988. Re: OII v 3.028 RF Gain encoder rate nuiscance bug?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-08 17:27:00 UTC
From: floydsense
Topic: 7982 Message: 7988

I tried it on my O2 and I see a similar thing here, but a worse ratio. I stuck a white tape pointer on the multi knob and tried the RF gain range on both main and sub. On main, it took just about 20 degrees less than 2 full turns to go from 1 to 100. For the sub, it was about 3/4 turn. There doesn't appear to be any menu option that would control the RF gain rate as there is for the VFO encoder rates.

Hi Floyd,

Good finding and thanks for sharing. I will take the info into the beta group and hopefully tt can include a fix for this into next release. Keep the findings coming!
I made a small adjustment in the serial port tester which shows the counts while turning knobs. This way you can recognize how many clicks with a certain angle.

Best regards, onno

Topic: 7918 Message: 7991

Hi Onno,

I agree. About the only button I use on the bottom is the AN, and that works well in V2.039d. With V3.028, none of the bottom controls did much as even the AN caused the Pops and Clicks in the LINE OUT circuit path. So, I'm back on 2.039d for now. (I do find that the Digital NB works on some "spike type" noise, like pulses from a engine with a bad spark plug.)

The Orion 2 is probably the nicest radio I've owned, and I've had many, but IMO it is only functioning at about 10% of what it can actually do. Being a SDR, the Orion 2 has so much potential and I hope that someday soon T*T will see this. People are buying the Flex Radio left and right and I believe T*T could capitalize on that market if they would put more time into software development.

73,
Sam

7992. VFO B loses signals Orion1

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-09 05:21:55 UTC
From: ko4xj
Topic: 7992 Message: 7992

My B VFO all of a sudden stopped hearing signals. There's noise but no signals. I can find a signal with VFO A but not with VFO B. This started here recently. Most times I have to do a MASTER RESET and I can start to hear signals but I lose them after a short period.

I read in a 2005 post of maybe some DSP issues?? Using ver 3.030

Will reload with a older version tomorrow and see what happens

Thanks
John

Hi John,

Do you have an idea how to reproduce the problem? Also do you have any remote control program connected to orion which writes / reads the orion through serial communication? Just want to understand the environment in order to help. Also did the firmware upgrade go smooth on your unit or did you have to disable the stop on error within upgrade program? Best regards, onno

Onno, I have not been able to reproduce any one thing that would cause this problem, it "just happens" and I do not have any remote softwatre connected to the rig. I have started using DXLab logging software but the VFO B works with it, when it does work, and this issue was there before I switched over to DXLab (was using Logger32 before)

I switched over to the firmware updates as they become available and each time they updated fine.

I just cannot reproduce the problem just yet but I'm paying more attention to when it happens

Thanks Onno

John

John-

I had exactly those symptoms once a long time ago which drove me crazy. I would hear atmospheric noise but no signal. Occasionally I would hear truly bizarre noises which seemed to be partially signal--but not signal from the ham bands. Tuning produced no change in the noise/signal. Finally I sent the set back to TenTec and they pronounced it a synthesizer out of "tolerance." After the report it's been fine for years. I'd call TenTec.

Subject: RE: [orion565] Re: VFO B loses signals Orion1

Onno, I have not been able to reproduce any one thing that would cause this problem, it "just happens" and I do not have any remote softwatre connected to the rig. I have started using DXLab logging software but the VFO B works with it, when it does work, and this issue was there before I switched over to DXLab (was using Logger32 before)

I switched over to the firmware updates as they become available and each time they updated fine.

I just cannot reproduce the problem just yet but I'm paying more attention to when it happens

Thanks Onno

John

Hi John,

Do you have an idea how to reproduce the problem? Also do you have any remote control program connected to orion which writes / reads the orion through serial communication? Just want to understand the environment in order to help. Also did the firmware upgrade go smooth on your unit or did you have to disable the stop on error within upgrade program? Best regards, onno

Thanks Bob.. Glad the email found you hi hi.. I've got a few issues that pop up but sometimes it's hard to nail down when and why they occur. Like right now I reloaded the newest firmware this morning and it seems to be working fine but will watch it closer and try to nail down when it goes bad then call TT

Thanks

John

I am glad to know about the synthesizer solution.

I have occasionally had the problem of VFOB not receiving signals and I found one "cure" to be simply turning the radio off and then back on. After doing this the VFOB works fine. For me it has been only an odd and mildly irritating problem since it only takes a few seconds to reboot the radio. Upgrading firmware doesn't seem to change this issue, which is not surprising if the cure is to retune the synthesizer.

Maybe there is an easy way to tweak the synthesizer to get it back into tolerance without having to send the radio back to TenTec.

7998. Some Receiver Features Issues

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-09 15:08:07 UTC
From: Bob
Topic: 7998 Message: 7998

Ok, we all know that HF rigs all have their claim to fame, but actual use of the rigs really determine the quality of the rig and the effectiveness of any features on the rig. My use of the OII tells me in my location, which I would describe as above average on most days, as relates to noisy, shows me every day how effective or unique the RF gain on the rig really is as compared to other rigs. To me the RF control on the OII reduces the noisy while leaving the signal with good volume control response. Other rigs, including the 5k, just can't do this. In fact, the RF control is the only reason I keep the OII and of course it is a classy looking rig like its owner, hi hi.

I only have one other thing to say about the receive features and I will get off my soap box. I can only compare the NB, NR and the AN with firmware V2.044A since I haven't upgraded, but none of these features on the OII impress me much. All of these receive feature on my OII have their problems unlike my 5k. Even my MKV, with the exception of the RF performance, can give the OII a run for the money.

All my comments are related to Phone Mode, I don't do CW or other digital modes very often and have very little interest in them.
Just my opinion, so don't stone me to dead. I enjoy all my rigs.

73,
Bob

Wow, what a surprise! I reported the same thing a week or two ago.

I'm assuming you're running a 565 and that you're using 3.xx? Right?

I have had exactly the same thing here.

Something else to try: see how much output your radio has on 10, 12, 15 and 17 meter SSB...I'll bet it's less than 25 watts. Try with the SP on and off, and see what the difference in SSB output is.

I reverted to 2.054 and everything works perfectly. SSB output on 10 meters at 100 watts and perfect second receiver performance.

I have reloaded 3.030 multiple times, until it finally seems to be solid. I still have low output on 10-20 meter SSB, but rarely use those bands with my Orion. My Orion II running the current 3.028 and new RX366 is working perfectly.

Cannot say the same for the Orion, however.

Any who have interest, please check out both second receiver performance as well as output on 10-20 meter SSB and report your findings, please.

Larry, W0PR

Like you Bob, I'm strictly HF Phone. In fact, I'll go one step further. I'm one of those guys most of you bitch at as I run ESSB (enhanced single sideband as described by most). I usually have my bandwidth set at the full 3.9 Khz, running outboard audio equalizers and compression (W2IHY), studio microphones, Behringer equipment, etc. Getting as close to FM two-way broadcast communications on sideband as possible is the end result. I'll be installing 2 DVD players next week when I go 24/7 Classic Rock 'n Roll !

Normally I only do this very early in the morning and only when there isn't anyone close-by on an adjacent frequency. That is one of the reasons I was hoping T*T would increase their transmitting BW to 5 Khz or more, lol.

Anyhow, I find the O2 to be the (almost) perfect exciter for my Alpha 91b or Ameritron 572 Amps.

I just wish the receiver's listed functions (NR,NB,AN) would work better. It's so much nicer when my ears don't bleed, lol.

8003. RE: [orion565] VFO B loses signals Orion1

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-09 17:02:27 UTC
From: John Hudson
Topic: 7992 Message: 8003

Larry I just went through all the bands (cw end and upper ssb ends) and checked my output. NOW At first I used what's in line and that's my 238B tuner and my AL-811H amp. Using the 238B inline the output appears to be low. Using the tuner meter it appears to indicate approx 15 watts and then cranking the POWER encoder up to 50-55 watts. Now the 238B meter is something to be desired since it does not have a very detailed scale.

The only other meter I have is a YAESU YS-200. I put it in line and it gives me a much higher output. At TUNE 25-26 watts and high power 120-121 watts ON ALL BANDS

I tested this in all configurations, but recorded straight from the O1 output into the YS-200 then into a dummy load

The only thing I found was even going through my amp in standby there was no change but once I put my 238B inline (O1 to 238B to YS-200 to dummy load) I found a couple of watts dropped but still 23-25 and 119-120)

I believe the YS-200 to be a better reliable measurement source than the 238B and the only reason I say that is I use the YS-200 on VHF and the power outputs on my FT2800 match the manufacturers specs

I'm using 3.030 BTW

One last test, I use a Heil ProSet Boom headset 100% of the time on SSB and do mostly DX'ing, not a lot of rag chewing. My setup with great audio reports is using the HC-4 DX cartridge, MIC set to 30 and SP at 7. Now testing into the dummy load with the tuner inline I get approx 70w with a "TESSSSSTTTT" with SP on and approx 30w with the SP off. Not lab quality tests but I operate in the garage and not in a lab :)

So I don't think I have a power output issue but until I get my hands on another watt meter I'll have to go with these measurements...hmm I have a old Heathkit SB-634 somewhere in storage, it probably is accurate!!

Good luck

John

Subject: Re: [orion565] VFO B loses signals Orion1

Wow, what a surprise! I reported the same thing a week or two ago.

I'm assuming you're running a 565 and that you're using 3.xx? Right?

I have had exactly the same thing here.

Something else to try: see how much output your radio has on 10, 12, 15 and 17 meter SSB...I'll bet it's less than 25 watts. Try with the SP on and off, and see what the difference in SSB output is.

I reverted to 2.054 and everything works perfectly. SSB output on 10 meters at 100 watts and perfect second receiver performance.

I have reloaded 3.030 multiple times, until it finally seems to be solid. I still have low output on 10-20 meter SSB, but rarely use those bands with my Orion. My Orion II running the current 3.028 and new RX366 is working perfectly.

Cannot say the same for the Orion, however.

Any who have interest, please check out both second receiver performance as well as output on 10-20 meter SSB and report your findings, please.

Thanks Russ... I did the A9 caps a couple of years ago, best I remember I had display issues..not sure if that;s right or not but I did change those. I have not change the battery yet but I may go ahead whether it's causing it or not

One thing I did forget to mention is I have a flacky power switch and one's on order. Most times I cannot power down with the power switch, the rig stays powered up and will turn off from a few minutes to several minutes after the power switch is turned off. Usually I use the power supply to turn off then turn the switch off and then I'm ready to power up normal the next time. One funny issue a week or so was the rig kept drifting and I mean drifting fast and could not figure out why. I turned the PS off and rebooted the rig, it was good but then started to drift again. I had left the power switch in the off position but the rig was still powered up and apparently there was enough "connection" to provide power but is was dropping voltage before complete shut down and causing funny things to happen. Maybe the new power switch will fix my issues?? We'll see

Hi John...

I had a slightly similar problem with my Orion I which was caused by the A9 board electrolytic capacitors beginning to go bad. Paul at TT said none of those caps should run warm nor have bulging tops, even slightly. Paul also mentioned the backup battery nearing its end of life can induce strange behavior such as you describe.

Hi john,

Ok thanks for sharing the environment. It is good to exclude variables around the orion to focus on root cause. I dont known if you can/want to install the backup and restore software (you need serial connection for it) but if possible please perform a backup of your settings and email me the backup-settings file. This way in can compare the settings as well. please keep an eye on this event and try to write down then key sequence you used prior to event. We might be lucky to recall the sequence and allow tt to fix the issue quickly.... but thats only possible when we are able to locate the root cause.. I am keeping an eye out too...

Motivation for my questions as raised earlier;

1- if firmware upgrade is done without error check the firmware will be send to the orion but you will not know if all code is accepted / valid... hence my question on smooth upgrade.

2- if you have some sort of remote control program polling the orion this might be part of the root cause. Could be invalid commands, invalid handshake etc. Hence my question on remote control software.

3- although theoretically not needed you could verify the firmware by running the firmware upgrade program in validation mode. This will check the firmware as present on the orion line by line and compare the line information with the firmware ruf filemon your computer... this will take a couple of minutes but confirm 100% valid firmware. Easy step to do and worth to confirm. If you have time please do so.

Best regards, onno

John,

I had this problem a few years back, and vfo B began to work again after I took the Orion apart to do the v.2 upgrade. It may be a matter of an oxidized or loose connection somewhere.

Good luck,

Stan, W4AG

OT: OBR 2951 available

Greetings,

Some minor changes to the program which might be of use;

1- additional validation of backup sequence 2- v3 error backup settings can now be restored into v2 orion. the restore function will skip the v3 specific objects and hence not send them to v2 orion. 3- included 5 seconds timeout in case communication fails. 4- tested with v2 and v3 latest beta code and all seems to work smooth

OBR setup 2951 standard.zip https://www.box.net/shared/gqbhq9ytnu6k470vy4pl

OBR OBR OBR setup 2951 XP special.zip https://www.box.net/shared/ud2rpm53de946z8ueotj

I had various responses on xp environment. Sometimes it works right away, sometimes one has to ensure windows update is completed prior to installation. I have created a new package using 4.x net and 3.1 installer which should make this a smooth ride too... please send me email hown it went?

Best regards, onno

8012. OT: Serial test setup V1020

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-11 21:43:41 UTC
From: pa1ap
Topic: 8012 Message: 8012

Included on the right hand a test cyclus (100 x 8 commands) which reads the following values when engaged;

1- Main and Sub RF
2- Main and sub AF
3- Main and sub RIT
4- XIT
5- Main and sub Frequency
6- Main and sub delta frequency since start of sequence. This with option to reset delta during the sequence.

Point 6 provides a way to adjust the VFO dials to a prefered position, click on reset delta and than turn VFO 360 degrees to see how many steps are made. I used it to test Floyds findings and for me the rig seems to provide the same resolution for main and sub.

Date: 2012-03-12 13:24:12 UTC
From: John Hudson
Topic: 7992 Message: 8023

An additional "FIND" with my VFO B issue.. What I found over the weekend is that VFO B does hear.. but on a reboot it hears on 14.035, the default frequency after a master reboot. No matter what band I tune to or tuning the VFO knob it's listening to 14.035. It just seemed like it was hearing nothing but I kept hearing a CW signal when I was in the phone band and finally found it. NOW the other scenario.. If I do a reset and the VFO B does work it's all good until it goes bad ;) then what ever frequency is in VFO B is stuck there. Example if I was working RTTY split and VFO B decides to stop working properly, that's the signal I keep hearing in VFO B. Again no change when I change bands or manually enter a frequency. I've gone back and put 2.063x and 2.062a in and the same issue. I cannot determine if there is any thing I'm doing to make this happen but running DXLab, FLDIGI and FLDIGI bridge, N8LP VCP on a XP PC .

Again others suggested a weak battery can cause strange issues but one was ordered Friday from TT but will not ship until today so I'll wait for that and see. I'll be replacing a bad power switch (rig won't power off with switch) and checking all the jumper cable connections when I get the covers off

If no fix is found..it's headed to TT HQ

Thanks

John

Before you send it back, try reloading 2.054. I had to go that far back
before everything worked as before.

Now, I have reloaded 3.030 multiple times, and it FINALLY works all the
time...receiver-wise...but still have low SSB output on 10-20 meters.

I seldom use my 565 on those bands, it's my second rig, nor do I use SSB
very often, so it's not a big issue, and I assume these will be addressed
with the next release.

See whether 2.054 will work.

Thanks Barry,
I didn't think it did as i tried that earlier the relay clicks are still there.
This must be the only radio that I cant seem to use the vox to keep it in TX whilst making my call , the relay clicks at every dot and dash.nice in QSK but not sure of the life of a relay used now and again in CW.
Anyone else have a solution to the CW operation .
The manual does not have much info about CW operation and this must be one of the most popular cw radios about.
Regards
Zoli M0ZOL
Oh and just updated to the newest firmware and there is a vast improvement to the radio, its now quite a joy to use . What does the SAF do , it seems to do something with the notch?
Cheers guys for the knowledge...

Well the PTT does key the rig in CW - at least on my radio. If I don't
want to listen to the relay and have a long transmission then I key the PTT.

The relay still clicks away, even with PTT asserted. What PTT buys you is
rx muting but the relay still clicks on each cw element.

are you using the optional fan on the heat sink when running continuous duty?
That may be the solution. If you are able to fold back the power you may be able to run longer without the fan.
Are you able to measure the heat sink temperature?

yes i do have a fan but does not help. I can cut the power back on
10 meters and run it a little longer. it does not take but about 1 min. to give me the high swr

I only had that happen to me once, and what the problem turned out to be was a cold solder joint at the apex of my antenna. It would heat up and eventually open (until it cooled down). This would only happen if I was running more than about 100 watts, and most times I do. As it would heat up the SWR would begin to rise.

To 565 users:

I also used the 317 on my Windows 7 64 bit machine and had no problems with the cable - just had to figure out which com port to use. That was not the cable's fault - and only took me a few minutes to decide on the appropriate port. I went from 1.373b5 to 3.030 and used both the RAM clear and master reset. Results were immediate, and well worthwhile.

I would be interested in hearing about any receiver comparisons made between other rigs and the 565 - using the new 3.030 firmware. Thanks in advance.

To John:

Thanks for following up on the "little things that mean a lot...", John. Still, V. 3.030 is a big improvement over previous levels/versions. It's amazing. I'll be watching for any updates.

73,

Jim, K8OZ

8036. RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)

GOT ANOTHER QUESTION

Has anyone ever had RFI problems effect their rigs?? Sounds funny but Paul from TT answered an email about my VFO B issue and wanted to know if I would try it with a logging program connected. I disconnected the cable from the PC to the rig and operated "old school" no logging program and it ran for hours today with no illeffects. I did not do a lot of QSO's but I did do tests on several bands using the amp and all ok

I then connected the cable and loaded up DXLab, my current log choice, and at the onset both VFO's were ok. I got brave and decided to try a contact on 17m with the amp, BAM, VFO B is back to being locked in a some freq but the display can be changed. I'm not too sure if it went south as I changed bands to 17m but it was after making the contact, which was simplex BTW. My cable is a home made cable but it's been in use for over a few years, last year I added signal lines for my STEPPIR controller. I know it does it with DXLabs and Logger32. I have DXbase and HRD also and will try it with them

Also on my power switch, the new switch does not power the rig down, Paul says "Turn on problem: Probably a problem with the turn on circuit on the back panel board, sounds like a leaky transistor."

Thanks in advance

John

BTW Still waiting on the TT battery and hope it's the magic fix

An additional "FIND" with my VFO B issue.. What I found over the weekend is that VFO B does hear.. but on a reboot it hears on 14.035, the default frequency after a master reboot. No matter what band I tune to or tuning the VFO knob it's listening to 14.035. It just seemed like it was hearing nothing but I kept hearing a CW signal when I was in the phone band and finally found it. NOW the other scenario.. If I do a reset and the VFO B does work it's all good until it goes bad ;) then what ever frequency is in VFO B is stuck there. Example if I was working RTTY split and VFO B decides to stop working properly, that's the signal I keep hearing in VFO B. Again no change when I change bands or manually enter a frequency. I've gone back and put 2.063x and 2.062a in and the same issue. I cannot determine if there is any thing I'm doing to make this happen but running DXLab, FLDIGI

and FLDIGI bridge, N8LP VCP on a XP PC .

Again others suggested a weak battery can cause strange issues but one was ordered Friday from TT but will not ship until today so I'll wait for that and see. I'll be replacing a bad power switch (rig won't power off with switch) and checking all the jumper cable connections when I get the covers off

If no fix is found..it's headed to TT HQ

Thanks

John

My B VFO all of a sudden stopped hearing signals. There's noise but no signals. I can find a signal with VFO A but not with VFO B. This started here recently. Most times I have to do a MASTER RESET and I can start to hear signals but I lose them after a short period.

I read in a 2005 post of maybe some DSP issues?? Using ver 3.030

Will reload with a older version tomorrow and see what happens

Thanks
John

It might be worth trying with the RS232 cable connected but no logging program running. If you have problems then, it suggests RFI via the RS232 cable. If no problems then, it suggests your logging program is sending a combination of commands that the Orion isn't happy with.
